CONTENTS

CIRCUIT DESCRIPTION

Overview of the Operation

The TS-2000/X basically consists of an all-mode-receiver incorporating an IF/AF DSP for satellite communication with an independent FM/AM sub-receiver for the VHF and UHF bands.

■ Overview of the operation of the all-mode transceiver unit (main band side) with an IF/AF DSP for satellite communication

The receiver unit has an independent front end for each of the HF, 50MHz, 144MHz, 430MHz and 1.2GHz bands (some products do not support the 1.2GHz band). The circuits following the 10.695MHz IF stage are common to all the bands. (Thus, it cannot receive two SSB signals at the same time.)

The IF frequency of the transmitter unit is shifted from the IF frequency of the receiver unit by 100kHz to enable satellite operation (full duplex operation). The final section is independent of the HF, 50MHz, 144MHz, 430MHz and 1.2GHz bands. Consequently, you can select a combination of bands permitting satellite communication from the HF, 50MHz, 144MHz, 430MHz and 1.2GHz bands.

The transmitter unit and receiver unit on the main band side operate simultaneously during satellite transmission. The receiver unit on the sub-band side does not work. (The sub-band receiver is not used during satellite operation.)

Two 16-bit DSP ICs are used; one performs IF processing (main band side) and the other carries out AF processing (main and sub bands). Although the DSP IC is a 16-bit unit, it carries out "double-precision operations" for critical parts of IF processing to perform 32-bit equivalent processing. In addition, the DSP IC uses a 100-MHz high-speed internal clock. The conversion from an analog signal to a digital signal (A/D conversion) is performed with 24 bits at high precision.

The DSP circuit for IF operates in any mode other than FM mode for both transmission and reception. FM modulation, detection and squelch processing are conventional analog processes. (The processing prior to modulation and after demodulation in FM is performed by the DSP.)

In the mode in which the IF DSP circuit operates, it carries out modulation and demodulation, digital IF filtering, digital AGC, and CW waveform processing during transmission, as in the TS-870. All these functions are operated in all the bands on the main band side, including satellite operation.

The AF unit is processed by the DSP in all modes. The operating range of the DSP circuit depends on the mode, but it performs beat cancellation, noise reduction, AF DSP filtering, etc.

■ Overview of the operation of the independent FM/AM sub-receiver unit (sub-band side) for the VHF and UHF bands

The local oscillator system and IF/AF signal system of the sub-receiver unit are independent of the main band side. Therefore, the sub-band receiver can receive signals while the main band receiver is sending a signal. (Except when reception is impossible due to harmonics of the transmit frequency and when the main band and sub-band are on the same frequency band.)

The sub-band receive signal is branched from the RF unit on the main band side. It is, therefore, not necessary to install a dedicated antenna for sub-band reception.

Transmission can be performed with the sub receive frequency by shifting the "PTT band" to the sub-band side. It is made possible by internally using the transmission function on the main band side.

AF processing is also carried out by the DSP on the sub-band side and the noise reduction function works.

The sub-band reception function, including display, can be turned off.

Frequency Configuration (Fig. 1)

This transceiver utilizes double conversion in FM mode and triple conversion in non-FM modes during transmission.

It utilizes triple conversion in FM mode and quadruple conversion in non-FM modes during reception. The fourth 12kHz IF signal is converted from analog to digital and connected to the DSP.

When the carrier point frequency of the signal input from the antenna is f_{IN}, the relationship between these signals when demodulating this signal is expressed by the following equations:

HF MAIN	$f_{IN} = f_{LO1} - f_{LO2} - f_{LO3} + f_{LO4} - 12kHz$
VHF MAIN	$f_{IN} = f_{LO1} - f_{LO2} - f_{LO3} + f_{LO4} - 12kHz$
UHF MAIN	$f_{IN} = f_{LO1} + f_{LO2} + f_{LO3} - f_{LO4} + 12kHz$
1.2G MAIN	$f_{IN} = f_{LO1} \times 2 + f_{LO2} + f_{LO3} - f_{LO4} + 12kHz$

Reference Signal Generation Circuit

The 15.6MHz reference frequency fstd for PLL frequency control is generated by the TCXO (X400). The signal passes through a buffer amplifier (Q420) and is used as the reference signal for the second local oscillator (HFLO2) for HF band reception and the first local oscillator (SLO1) subband reception.

The reference signal is doubled by Q412, and the resulting 31.2MHz signal is used as the reference signal for DDSs (IC406, IC407, IC408, IC601, IC602, IC603).

The 31.2MHz signal is supplied to the TX-RX2 unit (X57-606 A/11) as LO2 for VHF and UHF bands.

CIRCUIT DESCRIPTION

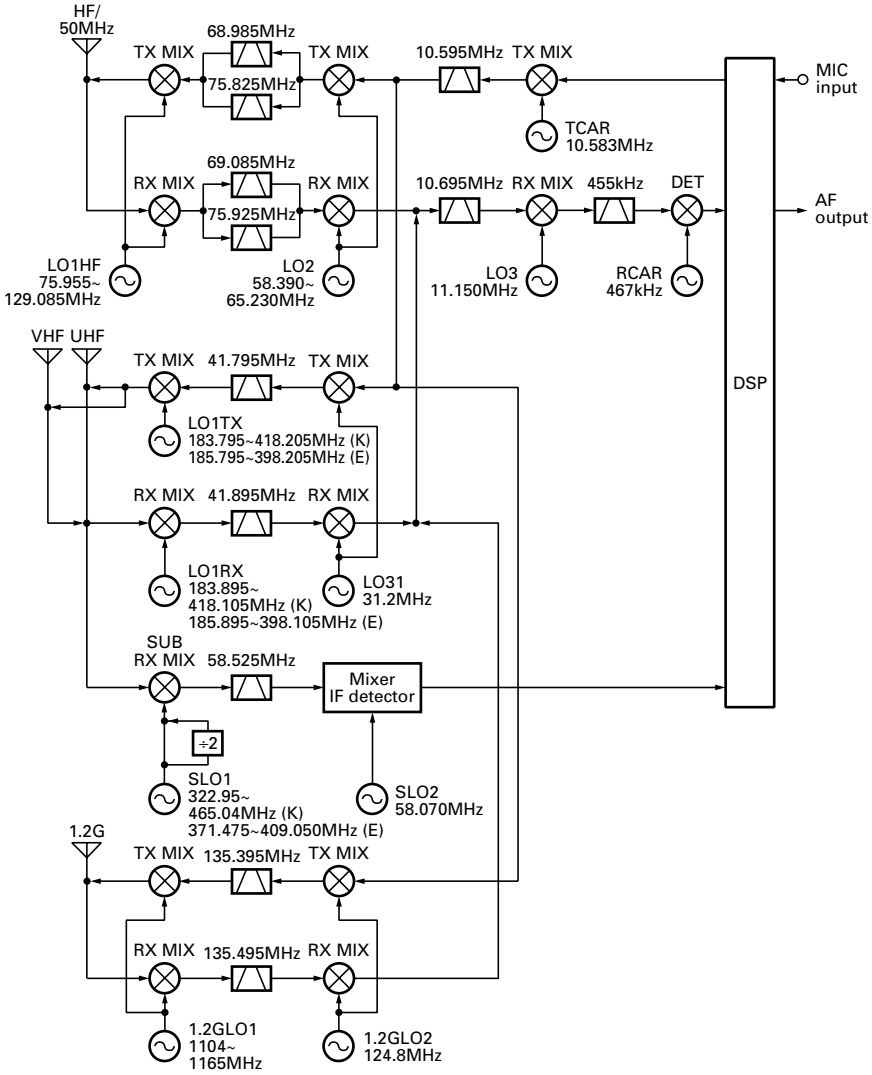

Fig. 1 Frequency configuration

HF/50MHz LO1

When the HF and or 50MHz band is operating in the main band, the HF REF VCO (Q427) generates 31.17 to 32.834 MHz. (See Table 1, frequency configuration.)

The output signal from the DDS (IC408) is input to pin 8 of the PLL IC (IC409) for HF REF, divided into 1/16 in IC409 to produce comparison frequency fø 2 of 487 to 513kHz.

The output signal from the VCO (Q427) goes to pin 6 of PLL IC (IC409), is divided into 1/64 in IC409, and compared with the signal with comparison frequency fø 2 by a phase comparator. The frequency is locked and the HF REF signal is output.

The output signal from the PLL IC (IC409) for HF REF is fed to pin 8 of the PLL IC (IC414) for HF LO1 as a reference frequency, and divided to produce comparison frequency fø 1 of 975 to 1358kHz.

The HF LO1 VCO (Q459, Q460, Q464) generates 75.955 to 129.185MHz. The output from this VCO goes to pin 6 of IC414, is divided into 1/N 1 in IC414, compared with the signal with comparison frequency fø 1 by a phase comparator. The frequency is locked and the HF LO1 output frequency is generated.

The DDS (IC408) sweeps output frequency (7.792 to 8.209MHz) in 10Hz steps by equation $f_{DDS\ STEP}$ (Hz) = (10*R 1)/(N 1*4) and in 1Hz steps by equation $f_{DDS\ STEP}$ (Hz) = (1*R 1)/(N 1*4), the HF LO1 covers the frequencies of 75.955 to 129.085MHz in 10Hz or 1Hz steps.

One of three VCOs (Q459, Q460, Q464) is selected by the signal (HF VCO1,HF VCO2,HF VCO3) from the serial-parallel IC (IC404).

The output from the VCOs (Q459, Q460, Q464) passes through a buffer amplifier (Q462), is amplified by Q476, and passes through a low-pass filter. The impedance is converted by an attenuator and the signal is output as HFLO1.

The cut-off frequency of the low-pass filter in the output section is changed by turning Q474 ON/OFF with a VCO select signal (HF VCO1).

CIRCUIT DESCRIPTION

HF LO2

When the HF and or 50MHz band is operating, the HF LO2 VCO (Q409) generates 65.230 to 58.390MHz. (See Table 1, frequency configuration.)

The 15.6MHz reference signal fstd is input to pin 8 of the PLL IC (IC401) for HF LO2, divided into 1/226 and 1/319 in IC401 to produce comparison frequency fø of 69.027 to 48.903kHz.

The output signal from the VCO (Q409) goes to pin 6 of IC401, its frequency is divided into 1/945 and 1/1194 in IC401, compared with comparison frequency fø by a phase comparator, and locked. The division ratio data comes from the control unit.

The output signal from the VCO (Q409) passes through a buffer amplifier (Q415), is amplified by Q421, and passes through a low-pass filter. The impedance is converted by an attenuator and the signal is output as HF LO2.

When the HF and or 50MHz band is not operating, Q403 is turned OFF with the LO2SEL signal and HF LO2 VCO (Q409) stops operation.

Table 1 Main HF and 50MHz band frequency configuration

CIRCUIT DESCRIPTION

144MHz LO1

When the VHF band is operating in the main band, the VHF REF VCO (Q441) generates 36.057 to 37.288MHz (K), 36.450 to 36.842MHz (E). (See Table 2, Frequency Configuration.)

The output signal from the DDS (IC406) is input to pin 8 of the PLL IC (IC411) for VHF REF and divided into 1/16 in IC411 to produce comparison frequency fø 2 of 563 to 583kHz (K), 569 to 576kHz (E).

The output signal from the VCO (Q441) goes to pin 6 of IC411 and its frequency is divided into 1/64 in IC411, compared with the signal with comparison frequency fø 2 by a phase comparator, and is locked.

The VHF REF PLL output signal is fed to pin 8 of IC410 as a reference frequency, and divided into 1/30 in IC410 to produce comparison frequency fø 1 of 1202 to 1243kHz (K), 1215 to 1228kHz (E).

The VHF LO1 VCO (Q433) generates 183.895 to 193.895 MHz (K), 185.795 to 187.895MHz (E) in receive mode and 183.795 to 193.795MHz (K), 185.795 to 187.795MHz (E).

The VCO (Q433) output signal goes to pin 6 of IC410, and its frequency is divided into 1/N1 in IC410 and compared with comparison frequency fø 1 by a phase comparator. The frequency is locked and LO1 is generated.

The DDS (IC406) sweeps output frequency (9.014 to 9.321MHz (K), 9.112 to 9.210MHz (E)) in 10Hz steps by equation $f_{DDS\ STEP}$ (Hz) = (10*R1)/(N1*4) and in 1Hz steps by equation $f_{DDS\ STEP}$ (Hz) =(1*R1)/(N1*4), the LO1 covers the frequencies of 183.895 to 193.895 MHz (K), 185.895 to 187.895MHz (E) in receive mode and 183.795 to 193.795MHz (K), 185.795 to 187.795MHz (E) in transmit mode in 10Hz or 1Hz steps.

The PLL output signal is changed by the switching circuit of Q469 (receive) and Q470 (transmit) so that the output amplifier and low-pass filter correspond to VHF band transmission and reception.

In receive mode, the signal is amplified by the broadband amplifier (IC415), and passes through a low-pass filter. The impedance is converted by an attenuator and the signal is output to the RF unit (X57-606) as the first local oscillator RXLO1.

In transmit mode, the signal is amplified by the broadband amplifier (IC416), and passes through a low-pass filter. The impedance is converted by an attenuator and the signal is output to the RF unit (X57-606) as the first local oscillator TXLO1.

When the VHF is not operating, Q436 is turned OFF with a signal from the serial-parallel IC (IC404) and VHF LO1 VCO (Q433) stops operation.

Table 2 Main VHF band frequency configuration

430MHz LO1

When the UHF band is operating in the main band, the UHF REF VCO (Q431) generates 378.105 to 418.105MHz (K), 388.105 to 398.105MHz (E) in receive mode and 378.205 and 418.205MHz (K), 388.205 to 398.205MHz (E). (See Table 3, Frequency Configuration.)

The output signal (8.328 to 8.475MHz (K), 8.344 to 8.469MHz (E)) from the DDS (IC407) passes through a ceramic filter (CF400), is input to pin 8 of the PLL IC (IC412) for UHF and divided into 1/16 in IC412 to produce comparison frequency fø of 520 to 530 kHz.

The output signal from the VCO (Q431) goes to pin 6 of IC412 and its frequency is divided into 1/N in IC412, compared with comparison frequency fø by a phase comparator, and is locked.

The DDS (IC407) sweeps output frequency (8.328 to 8.475MHz (K), 8.344 to 8.469MHz (E)) in 10Hz steps by equation $f_{DDS\ STEP}$ (Hz) = 10*R/N and in 1Hz steps by equation $f_{DDS\ STEP}$ (Hz) = 1*R/N, the LO1 covers the frequencies of 378.105 to 418.105MHz (K), 388.105 to 398.105MHz (E) in receive mode and 378.205 to 418.205MHz (K), 388.205 to 398.205MHz (E) in transmit mode in 10Hz or 1Hz steps.

The PLL output signal is changed by the switching circuit of Q471 (receive) and Q472 (transmit) so that the output amplifier and low-pass filter correspond to UHF band transmission and reception.

In receive mode, the signal is amplified by the broadband amplifier (IC415), and passes through a low-pass filter. The impedance is converted by an attenuator and the signal is output to the RF unit (X57-606) as the local oscillator signal RXLO1.

In transmit mode, the signal is amplified by the broadband amplifier (IC416), and passes through a low-pass filter. The impedance is converted by an attenuator and the signal is output to the RF unit (X57-606) as the local oscillator signal TXLO1.

When the UHF is not operating, Q434 is turned OFF with a signal from the serial-parallel IC (IC404) and UHF VCO (Q431) stops operation.

Table 3 Main UHF band frequency configuration

SUB LO1

When the sub band receiver is operating, the sub VCO (Q406, Q407) generates 322.95 to 465.040MHz. (See Table 4, frequency configuration.)

The 15.6MHz reference signal fstd is input to pin 8 of the PLL IC (IC402) for the sub VCO, divided into 1/R in IC402 to produce comparison frequency fø of 5 and 6.25kHz. The division ratio data comes from the control unit.

The output signal from the VCO (Q406, Q407) goes to pin 6 of IC402, its frequency is divided into 1/N in IC402, compared with comparison frequency fø by a phase comparator, and locked.

The output signal from the VCO (Q406, Q407) passes through a buffer amplifier (Q413, Q414), is amplified by the broad-band amplifier (IC405), and passes through a low-pass filter. The impedance is converted by an attenuator and the signal is output as SLO1.

When the sub band receiver is not operating, Q411 and Q411 are turned OFF with the BSW1 and BSW2 signals and sub VCO (Q406, Q407) stops operation.

Table 4 Sub band frequency configuration

CIRCUIT DESCRIPTION

1.2GHz Unit Local Oscillator

The 12LO31 signal (31.2MHz) is quadrupled to 124.8MHz in Q14 and 15. This signal is sent to the mixers of the transmitter section (Q1 and Q2) and the mixers of the receiver section (Q7 and Q8)

In the DDS (C4) , 8.323~8.488MHz are output using 12LO31 as the reference signal. This signal passes through a filter (CF1 and CF2) and is input to the mixers for reference PLL signals (Q313 and 314).

In Q313 and Q314, the DDS output is mixed with 12LO31 (31.2MHz) and an approximately 39.6MHz signal is obtained. This signal passes through a filter and an amplifier (Q312) and becomes the reference signal of the PLL IC (IC5).

The VCO (Q301) oscillates at 552.253~582.303MHz. This signal is amplified in Q302 and goes to the PLL IC (IC5) and Q19.

The PLL IC (IC5) divides the reference signal (approximately 39.6MHz) to 1/72. The signal from Q302 is divided to 1/N (N=1006~1058).

The two signals are compared in the phase comparator within the IC and the VCO (Q301) oscillation frequency is locked.

The signal input into Q19 is doubled. This signal passes through a filter and an amplifier (Q20) and goes to the sending mixer (D1) and the receiving mixer (Q10).

Table 5 1.2GHz band frequency configuration

Local Signals

The RXLO3 (11.15MHz) and RCAR (467kHz) for reception and TCAR (10.583MHz) for transmission are output from DDSs (RXL03 : IC603, RCAR : IC601, TCAR : IC602).

The frequencies of local oscillator output signals (LO1, LO2, RCAR, TCAR) for each band are shifted by offset (IF filter setting), RIT, XIT, IF SHIFT as listed in Tables 5 to 11.

CIRCUIT DESCRIPTION

HF Receiver System and Main IF System

Three antenna terminals used for the HF and 50MHz band reception are ANT1, ANT2 and HF RX ANT.

After the incoming signal from ANT1 and ANT2 passes through the transmission/reception changeover relay in the filter unit (X51-315), and is sent to the HFRX terminal of the TX-RX unit (X57-605). There is an HF RX ANT terminal there, and one of the antennas can be selected from the menu for reception .

The HF RX ANT terminal is used to connect a dedicated HF-band low-band receiving antenna, such as a Beverage antenna, and operates at frequencies up to 30MHz. (If an antenna, such as a solid wire antenna, is connected to this terminal, unwanted radio signals in the shack may be picked up. It is recommended that a 50 (coaxial cable be used for routing in the shack.)

The signal passes through an RF ATT, an image filter and a limiter for surge absorption and enters the RF BPF for both transmission and reception. The division of the RF BPF is in the range shown in the block diagram. For 6.9~7.5MHz, 13.9~14.5MHz and 49~54MHz, a dedicated BPF (adjustable type) is used and particularly effective for eliminating unwanted signals in the low band. Other BPFs (non-adjustable type) are designed as circuits with independent armature bands, except that the 24MHz and 28MHz bands are shared. Signals pass through these BPFs at the time of transmission, so they are useful for producing radio signals with little radiation.

Although the conventional RF ATT had an attenuation level of 20dB, the attenuation level of the current RF ATT is 12dB. It can, however, be changed to approximately 20dB by removing the jumper (CN2) near the ATT within the unit.

The pre-amplifier (Q12, Q705) have been changed to a power MOS FET from the combination of the conventional cascade amplifier and MOS FET amplifier. This element is a FET that is used in a younger stage for transmission and has excellent large input characteristics. The actual circuit contains two amplifiers using this FET. Large input characteristics with a low gain are given priority on the low band (Q12) with respect to 21.5MHz, and sensitivity is given priority on the high band (Q705). circuit on the low band side bordering 21.5 MHz favoring a gain with moderately large input characteristics and that on the hybrid side (Q705) favoring . When the pre-amplifier is off, the signal from the RF BPF enters the receiving first mixer (Q7~Q10) in the next stage as it is.

The receiving first mixer circuit uses a double balance type mixer with four joint type FETs. The signal is converted to the first IF frequency by the first local oscillator signal. The TS-2000S has adopted a method that changes the first IF frequency according to the receive frequency. For this reason, it has two sets of roofing filters (MCF) that determine the selectivity of the first IF. Table 1 shows the relationship between the receive frequency and the first IF frequency. The central frequencies for the reception and transmission of the first IF frequency are different from each other by 100kHz because the transmission and reception is performed simultaneously during satellite communication.

RX/TX frequency (MHz)	RX 1st IF (MHz)	TX 1st IF (MHz)
0.03~ 9.0	75.925	75.825
9.0 ~17.0	69.085	68.985
17.0 ~24.0	75.925	75.825
24.0 ~26.0	69.085	68.985
26.0 ~30.0	75.925	75.825
30.0 ~37.0	69.085	68.985
37.0 ~49.0	75.925	75.825
49.0 ~60.0	69.085	68.985

Table 13 RX frequency and 1st IF frequency

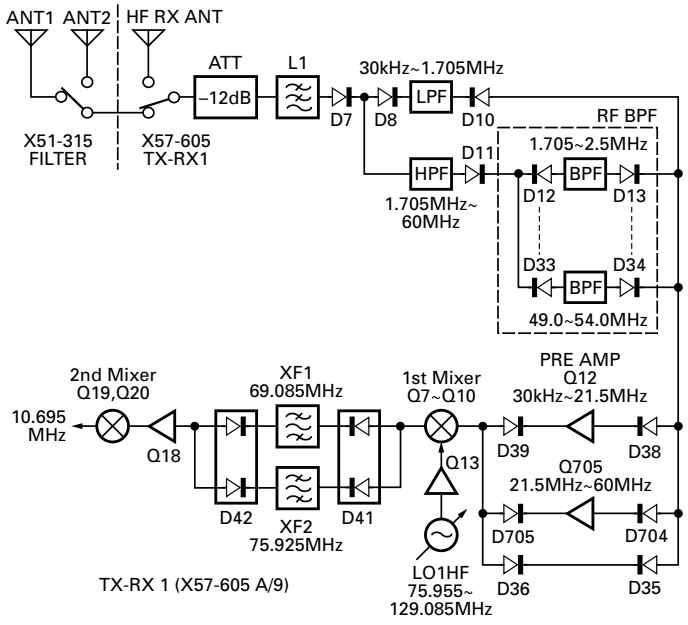

Fig. 3

CIRCUIT DESCRIPTION

The signal is then amplified by the first IF amplifier (Q18) and is converted to the second IF frequency of 10.695MHz in the second receive mixers (Q19, 20). The tuning frequency of each stage, the second local oscillator frequency and others are changed according to the receive frequency to respond to the changeover of the previously stated first IF frequency.

A circuit for changing over the IF signal from the units of the VHF, UHF and 1.2GHz bands and IF signal from the HF band is provided on the output side of the second receive mixer. That is, the circuits following this stage are commonly used circuits, regardless of the receive frequency on the main side.

In addition, there is a semi-fixed volume (VR4) on the output side of the first receive mixer. The volume is used to eliminate the gain differential generated due to the changeover of the first IF frequency.

The signal for the noise blanker is extracted from this point by passing through Q22. The noise blanker circuit is based on the same principle of operation as the conventional one, but can change the threshold level by changing the emitter potential of the noise detection stage (Q29).

The 10.695MHz signal is amplified by Q26 which also serves as a noise blanker gate circuit and passes through a 10.695MHz IF filter. It has three bandwidths, 2.7kHz, 6kHz and through, and when it is combined with the 455kHz filter group, the same continuous band change function (analog IF throughput: operation in modes other than FM) as in conventional analog devices is implemented. The band in this analog stage does not affect the operation of the digital IF filter in the IF DSP and is automatically set to the optimum band for removing unwanted signals outside the band.

Then, the signal is converted to the third IF frequency of 455kHz in the third receive mixer (Q700, 701). The 455kHz filter has three bandwidths: 2.7kHz, 9kHz and 15kHz. In FM mode (main band side) the 15kHz filter is selected for WIDE and the 9kHz filter is selected for NARROW, and signals passing through the filter are sent to the FM IC (ICI), amplified and detected. IC1 processes squelch, S meter, etc.

As a characteristic operation in this stage, a tuning error detection voltage for the ALT function operating in the 1.2GHz band FM mode is generated. It utilizes the DC voltage that is overlapped with the ICI detection output.

In a mode other than FM, the receive signal is amplified by the next third IF amplifier (Q38) and operational amplifier (IC18) and converted to the final 12kHz IF frequency by the fourth receive mixer (IC3). The converted IF signal in FM (audio signal) and non-FM mode (IF signal) is selected by the multiplexer (IC7) and the signal is sent to the DSP of the control unit for processing. The signals processed in the control unit become audio signals in all modes and return to the TX-RX1 unit (X57-605). These audio signals are power amplified to the level that drives the speaker with the AM amplifier (IC9).

A speaker separation function is available as an accessory circuit. The bands can be changed as shown in Table 14.

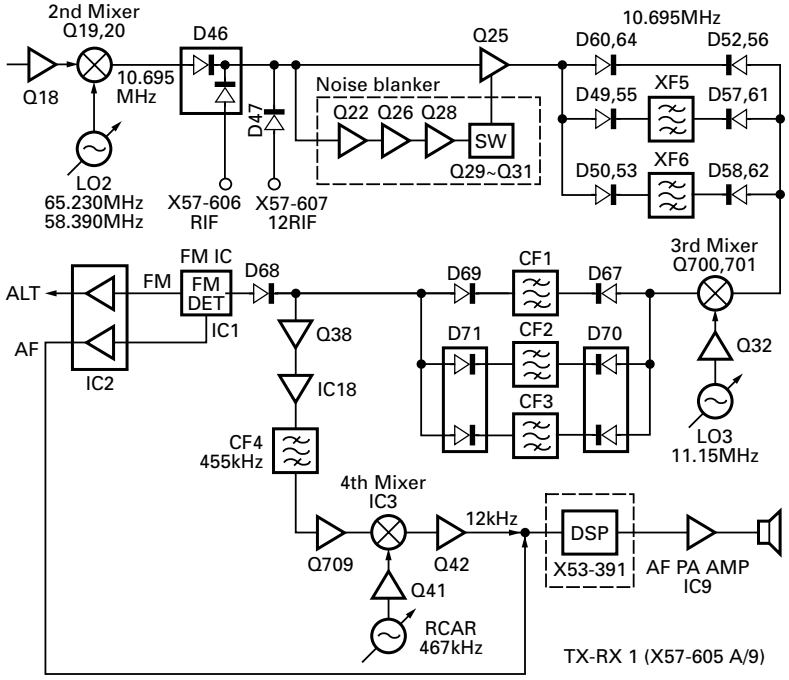

Fig. 4

CIRCUIT DESCRIPTION

■ Speaker output changeover

When external speakers 1 and 2 and headphones are connected, you can change over the sub/main band outputs.

The headphone connection is preferred over the all the speaker output and you can select from three patterns for headphone left-right changeover.

When SP1 only has been connected, the built-in speaker will change over to SP1.

When SP1 and SP2 are connected, you can select the SP1 and SP2 output method from three patterns, the same as for the headphones.

Connection Conditions (● : connected)				Output condition by connection of left table			
Headphone	SP1	SP2		Headphone	Built-in speaker	SP1	SP2
●	X	X	→	Pattern 0~2	Stop	X	X
●	●	X	→	Pattern 0~2	Stop	Stop	X
●	●	●	→	Pattern 0~2	Stop	Stop	Stop
●	X	●	→	Pattern 0~2	Stop	X	Stop
X	●	●	→	X	Stop	Pattern 0~2 (Left)	Pattern 0~2 (Right)
X	X	●	→	X	Pattern 0~2 (Left)	X	Pattern 0~2 (Right)

Pattern 2	Main	Sub	main	Sub

This is a reverse function and left-right changeover is possible.

Table 14

Main VHF/UHF Band Front-End and Sub Receiver System

The VHF and UHF band receiver circuit is configured with two systems, a main band (FM/ AM/ SSB/ CW/ FSK) and a sub-band (FM/AM), each of which has a VHF and a UHF band path.

In the main band, the first IF is 41.895MHz and the second IF is 10.695MHz and the signal lower hetero to the second IF is sent to the TX-RX1 unit (X57-605) and linked to the second IF, which is shared by the other bands. The sub-band is a double conversion where the first IF is 58.525MHz and the second IF is 455kHz. It is configured so that detected AF signals are sent to the control unit (X53-391).

■ VHF/ UHF band front end

The circuit operation of the sub-receiver unit differs depending on whether it is for K destination or others. The circuit operation for each of the destinations is described below.

- **K destination**

The incoming signal from the VHF band antenna terminal passes through the TX/RX changeover relay (K2) in the filter unit (X51-315) and goes to the TX-RX2 unit (X57-606). Then, it passes through the 12dB ATT circuit and is divided to the 136~155MHz path and the 118~136MHz, 155~174MHz and 220~300MHz path by the L distribution circuit. The 136~155MHz signal passes through a 2-pole BPF (band-pass filter) and enters the pre-amplifier (Q15). The amplified receive signal is again distributed to the paths for the main and sub receiver units by the L distribution circuit.

The signal distributed to the main receiver unit passes through the 2-pole variable tuning BPF, is amplified by the second amplifier (Q24) and goes to the mixer (IC4) for the main band common to the VHF and UHF bands through the variable tuning BPF. The 2-pole x 2-stage BPF for the main band VHF controls the tuning frequency by output from the D/A of the TX-RX1 unit (X57-605).

CIRCUIT DESCRIPTION

The 118~174MHz signal distributed to the sub-receiver unit passes through a variable tuning filter and is amplified by the second amplifier (Q24). Then, it passes through the 2-pole variable tuning BPF, and the 220~300 MHz signal is amplified by Q23 and is then input into the mixer (IC5) for the sub-band common to the VHF and UHF bands. The 1-pole and 2-pole BPFs for the sub-band VHF also controls the tuning frequency by the output from the D/A of the TX-RX1 unit (X57-605).

The incoming signal from the UHF band antenna terminal enters the UHF section of the final unit (X45-360), passes through the HPF and LPF and goes to the TX-RX2 unit (X57-605). Then, it passes through the 12dB ATT circuit and goes to the pre-amplifier (Q14). The amplified receive signal is distributed to the paths of the main and sub-receiver sections by the L distribution circuit.

The signal distributed to the main receiver section passes through the 3-pole variable tuning BPF and is amplified by the second amplifier (Q21). Then, it passes through the 3-pole variable tuning BPF and is input into the mixer (IC4) for the main band.

This 3-pole x 2 stage BPF for the UHF also controls the tuning frequency by the output from the D/A of the TX-RX1 unit (X57-605).

The 438~450MHz signal distributed to the sub-receiver section passes through the SAW filter (L29), is amplified by the second amplifier (Q25), and passes through another SAW filter (L50). The 300~438MHz and 450~512MHz signals are amplified by Q19 and goes to the mixer (IC5) for the sub-band.

- **E, E2 destinations**

Then, the signal passes through the 12dB ATT circuit and the 2-pole BPF (band-pass filter) and enters the pre-amplifier (Q15). The amplified receive signal is distributed to the paths of the main and sub receiver sections by the L distribution circuit.

The signal distributed to the sub-receiver section passes through a variable tuning filter and is amplified by the second amplifier (Q22). Then, it passes through the 2-pole tuning BPF, and goes to the mixer (IC5) for the sub-band common to the VHF and UHF bands. The 1-pole + 2-pole BPFs for the sub-band VHF also control the tuning frequency by the output from the D/A of the TX-RX1 unit (X57-605).

The signal distributed to the sub-receiver section passes through the SAW filter (L29), is amplified in the second amplifier (Q25), passes through another SAW filter (L50) and goes to the mixer (IC5) for the sub-band.

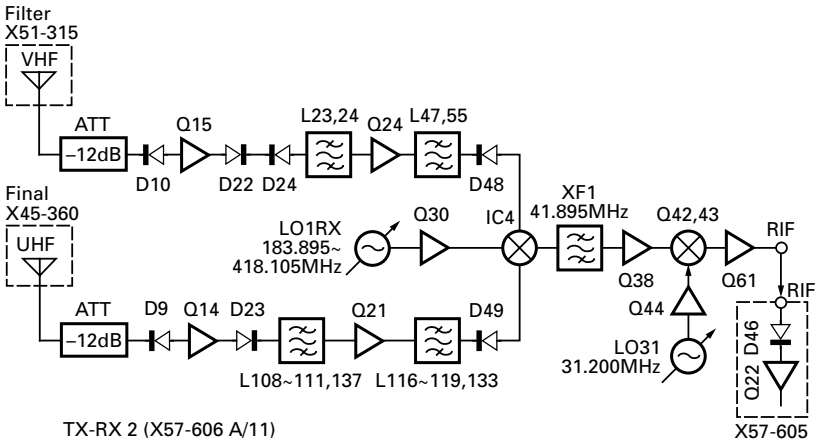

Fig. 5 Main band receiver section

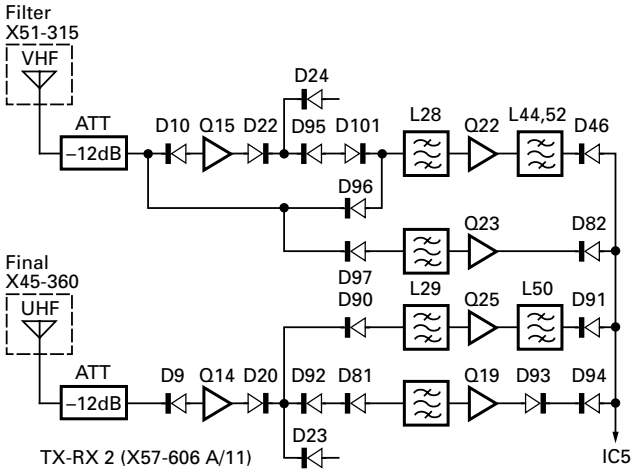

Fig. 6 Sub band receiver section

CIRCUIT DESCRIPTION

■ Main receiver IF section

The signal input to IC4 is mixed with the signal produced by amplifying the first local oscillator RXLO1 from the PLL section by Q30 and lower hetero to the first IF of 41.895MHz. Then, it passes through the MCF (XF1) and AGC amplifier (Q38) and goes to the second mixer (Q42 and 43). The signal input to the second mixer is mixed with the signal produced by amplifying the second local oscillator 21.2MHz from the PLL section by Q44 and lower hetero to the second IF of 19.695MHz. The signal then passes through a temperature compensating resistor and the IF amplifier (Q61) and is sent to the TX-RX1 unit (X57-605).

■ Sub receiver IF section

The signal input to IC5 is lower hetero to the first IF of 58.525MHz. In the VHF band, the local oscillator SLO1 from the PLL section is divided into two by the divider (IC6) and passes through amplifier (Q23). In the UHF band, the IF signal passes through amplifier (Q33) and is input to IC5. The IF signal passes through the MCF (XF2), passes through the post amplifier (AGC amplifier in the AM mode) Q37 and goes to the FM IC (IC7). The local oscillator is supplied to IC7 by the 58.07MHz crystal oscillator (X1) and is lower hetero to the second IF of 455kHz by a mixer in the IC.

The circuit operation when the signal passes through a ceramic filter after lower hetero is different for K destination and E destination. The circuit operation for each of the destinations is explained below.

• K destination

In FM mode, the signal passes through a ceramic filter (CF1), is quadrature-detected, and the resulting signal is output.

• E, E2 destinations

The signal passes through a ceramic filter (CF1) in FM WIDE mode and it passes through a ceramic filter (CF2) in FM NARROW mode. The signal is then quadrature-detected and the resulting signal is output.

In AM mode, a 455kHz signal passes through the AGC amplifier (Q51) and amplifier (Q48 and Q45) and is detected by D58. The detection signal retrieved for the AGC is rectified, passes through the DC amplifier (Q39) for AGC control and goes to the Q37 gate terminal (G2).

The FM/AM detection signal is switched by the multiplexer (IC8). Then, it is amplified by the operational amplifier (IC9) and output to the control unit (X53-391).

■ Squelch voltage and S-meter voltage of the sub receiver section

The S meter voltage is introduced to the A/D through a LPF for RSSI output of the FM IC (IC7).

The squelch voltage is supplied to the A/D by passing the detection output of the FM IC through a filter amplifier in the FM IC, amplifying it with the noise amplifier (Q63), and rectifying it with D83.

1.2GHz Unit Receiver Section

The incoming signal from the antenna (12ANT) passes through a filter, is amplified in the receiver RF amplifier (Q11 and 12) and input to the first mixer (Q10).

The signal is converted to the first IF (135.495MHz) in Q10, passes through the MCF (XF1) and the AGC amplifier (Q9) and enters the second mixer (Q7 and Q8).

The signal is converted to the second IF (10.695MHz) in Q7 and Q8, amplified in the receiver IF amplifier (Q303) and sent to the TX-RX1 unit (X57-605).

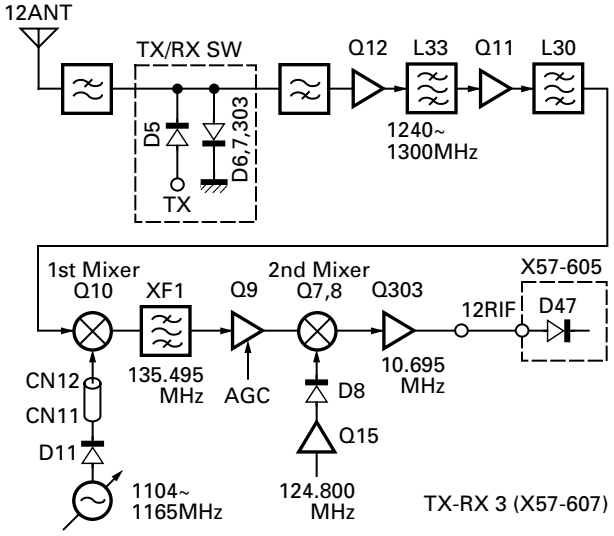

Fig. 9

CIRCUIT DESCRIPTION

Transmit System IF Section

■ Transmission IF

The details of the processing by the DSP depend on the mode.

- **Modes other than FM**

Transmission bandwidth change, speech processor and microphone gain control are performed in the AF stage. A 12kHz IF signal is produced after PSN modulation and output modulation control.

- **FM mode**

The baseband processing in the AF stage is carried out by the DSP and a VCXO (voltage controlled X'tal Oscillator) is used as a modulator.

The transmit signal output from the control unit (X53-391) is switched by an analog SW (IC8) and is input to the balanced mixer (IC6). The 12kHz IF signal and local oscillator signal enters the IC6 and become a 10.595MHz signal. The local oscillator signal is generated by the DDS (IC602).

The 10.595MHz IF component is amplified by the IF amplifier (Q54) and passes through the 6kHz bandwidth crystal filter, then becomes a 10.595MHz IF signal by eliminating local oscillator signals. The diode switch (D90) changes between FM modulator output and non-FM 10.595MHz IF signals.

The temperature compensation of the transmitter circuit is done by the thermistor near the IF amplifier (Q54) and the thermistor on the input side of the IF amplifier (Q711). They reduce the gain at low temperatures and raise it at high temperatures.

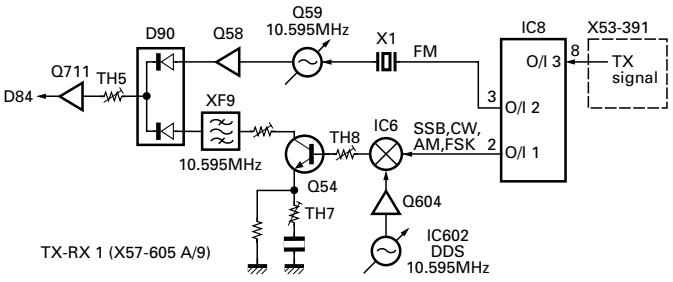

Fig. 10

The output signal from the IF amplifier (Q711) passes through D84, Q40, D82, D48, D80 and D81 and becomes the IF transmit signal for each band. D84 is a voltage controlled attenuator circuit. This circuit changes the attenuation level according to the control voltage (TGC), in the same way as the TGC (TX gain control) used in the TS-870 and TS-570 and is set to the adjusted attenuation level for each band. Q49 is an IF amplifier circuit with an ALC circuit. The gain is controlled by the voltage generated by the ALC circuit.

D82 is a voltage controlled attenuator circuit as D84. The attenuation level is minimum at full power and as the power decreases, the control voltage rises and the attenuation level increases. When the power is reduced, the gain will become relatively excessive if the IF gain is not lowered. It is set to an attenuation level adjusted by the PGC (Power Gain Control) accordance to the power of each band.

Q48 is an IF output buffer. It changes to the transmitter section of each band with a diode switch (D80, D81) to supply a 10.595MHz IF signal.

During transmission in the 144MHz and 420MHz bands, the signal is output to the TX-RX2 unit (X57-605), and during transmission in the 1.2GHz band, it is output to the TX-RX3 unit (X57-605).

In the 1.8~54MHz band, the frequency is converted to the final target transmit frequency in the TX-RX1 unit (X57-605).

The local oscillator frequency changes according to the band in second transmit mixer of Q46 and 47 to generate different IF frequencies. (TX third IF: 68.985MHz or 75.825 MHz)

D703 and D715 are used to change the tuning frequency of the local oscillator signal and D79, D78, D77 and D76 are used change the frequency of the IF filter (L102).

The variable tuning filter containing these variable capacitance diodes performs the coarse adjustment of the coil (L100, L99, L98, L96, L102) in the band (18.085MHz) where the IF is 75.825MHz. Then, it changes the tuning frequency control voltage from the D/A in the band (14.100MHz) where the IF is 68.985MHz and tunes it to the necessary frequency by readjusting the coil.

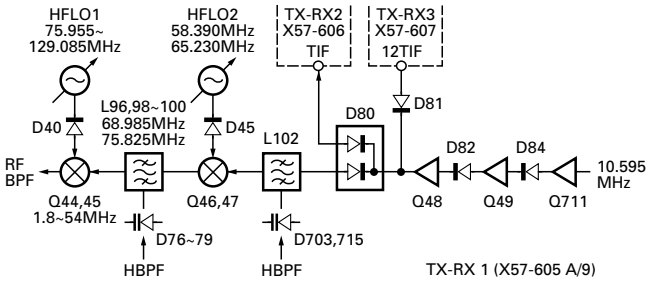

Fig. 11

CIRCUIT DESCRIPTION

The third IF signal is input to the third transmit mixer (Q44, 45).

A GaAs FET is used to obtain the satisfactory intermodulation characteristics. VR3 adjusts the second gate voltage to maximize the gain. VR2 adjusts the balance of the source current of two FETs and prevents the generation of spurious components by minimizing IF output leakage. It also adjusts the leakage of the IF signal (68.985MHz) to the minimum during 50MHz band transmission.

The signal with the target frequency passes through the BPF shared by the receiver section to eliminate spurious components. The transmitter circuit is separated from the receiver circuit to implement satellite communication, but only this BPF is shared to prevent generation of spurious components.

Finally, the signal is amplified to a sufficient level (approximately 0dBm) by the broadband amplifier and supplied to the final section. Q43 is a power MOS FET and provides an output of approximately 20dBm when the ALC is inactive.

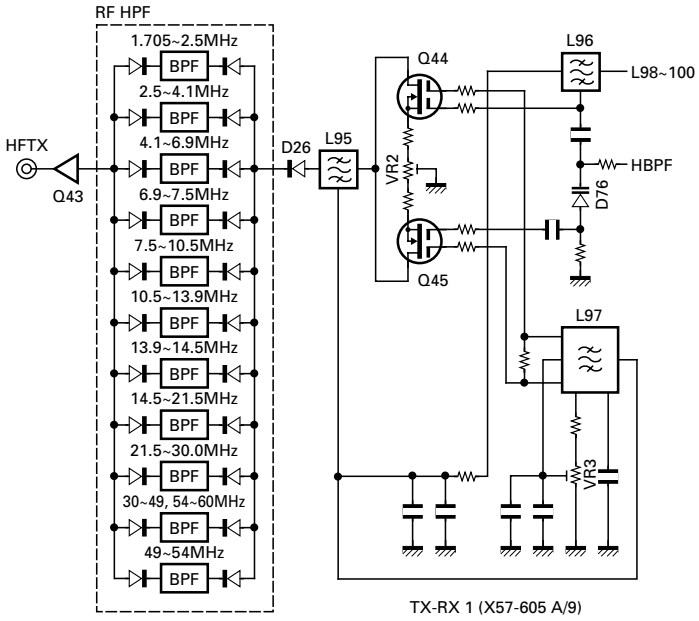

Fig. 12

■ ALC

The progressive and reflected wave signals detected by the final section in each band enters the TX-RX1 unit (X57-605) and is synthesized by a diode. It is synthesized simply because no signal is transmitted in multiple bands at the same time.

When the progressive signal voltage is input, it is divided by a resistor, and enters the differential amplifier composed of Q73 and Q74. When the voltage increases, the emitter voltage rises, the base current of Q74 decreases, and the collector voltage of Q74 also rises. When the voltage exceeds the base emitter voltage plus the emitter voltage (approximately 2.4V) of Q76, the base current of Q76 begins to flow and the voltage of the collector to which the ALC time constant CR is connected decreases. This collector voltage is buffered by Q78, the voltage is shifted by D108, and matched with the keying control voltage by Q79 and D111 to produce the ALC voltage. When the ALC voltage (2.7V when inactive) decreases, the second gate voltage of the IF amplifier (Q49) decreases and the gain lowers.

During AM transmission, Q75 turns on approximately 20ms after transmission, and the ALC voltage is controlled by the average power. The voltage output from the DAC (IC14) is applied to the base voltage of Q74, which is the reference voltage of the ALC. This DAC (IC14) is controlled by the adjustment value (POC) from the main microcomputer. In addition, the input voltage of the DAC fluctuates according to the power supply voltage and the output drops when the voltage is reduced.

■ SWR protection

The reflected wave detection signal is divided by the DAC (IC14) and input to the base of Q77. When this voltage increase, the collector current of Q77 increases and output power is limited.

■ Meter voltage

The progressive wave voltage is calculated as the power meter voltage, the reflected wave voltage is calculated as the progressive wave voltage and its value is input as the SWR meter voltage, and the ALC voltage is input as the ALC meter voltage. These voltages are input into the A/D converter of the main microcomputer.

■ Packet signal

The control unit contains a TNC and a changeover switch circuit that enables data signals to input from the ACC2 connector. (See the block diagram)

The 1200bps signal is processed by the DSP in the same way as for audio signals, but the 9600bps signal is input directly to the FM modulator without passing through the DSP.

CIRCUIT DESCRIPTION

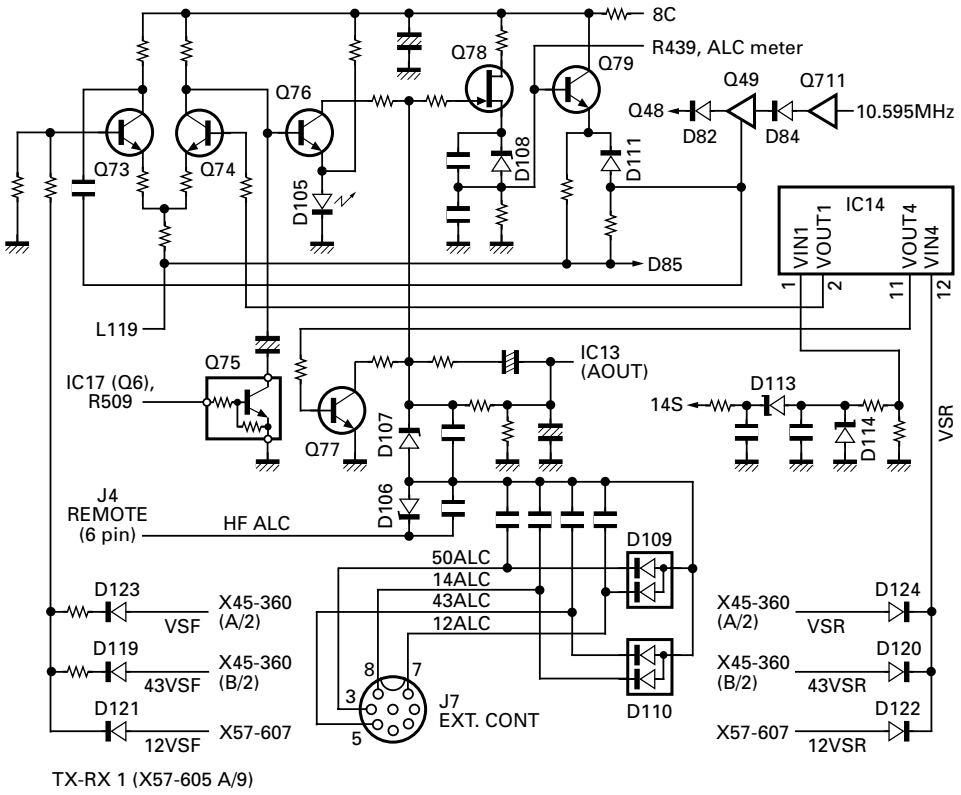

Fig. 13

VHF/UHF Band Transmitter Circuit (RF~IF)

The TIF (10.595MHz) signal input from the TX-RX1 unit (X57-605) first enters the mixers (Q46 and 47). The 31.2MHz signal from the PLL passes through the RF amplifier (Q50), enters the mixer as a local oscillator to output the 41.795MHz IF through both the signals. It passes through the 41.795MHz MCF (XF3) and enters the wideband diode mixer (D54) in the next stage, and upper hetero to a VHF/UHF band output signal. The local oscillator TXLO1 of the mixer is on a common line for both VHF and UHF band local oscillators, and the local oscillator signal is amplified by the VHF and UHF band broadband amplifier (Q34) and supplied to the mixer.

The signal converted to the VHF/UHF band is divided into a VHF band path and a UHF band path after it is output from the mixer.

The VHF band signal passes through a filter and a trap and is amplified in the 2-stage RF amplifiers (Q20, Q18), and the resulting signal goes to the wideband amplifier (IC3) common to the VHF and UHF bands.

The UHF band signal is amplified by the RF amplifier (Q17), passes through a 3-pole variable tuning BPF and is amplified by the amplifier (Q26). Then, it passes through a 2-pole variable tuning BPF and enters IC3. The total 5-pole variable tuning BPF controls the tuning frequency according to the control signal output from the D/A converter of the TX-RX1 unit (X57-605).

The signal amplified by IC3 is again divided into VHF band and UHF band paths by a diode switch and output to the final unit (VHF band: X45-360 A/2, UHF band: X45-360 B/2).

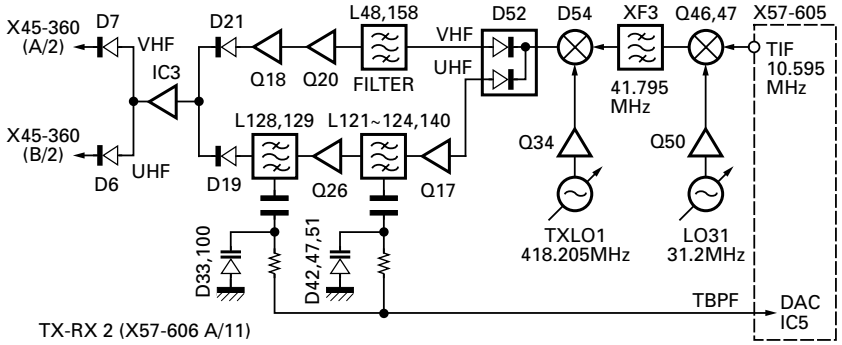

Fig. 14

CIRCUIT DESCRIPTION

Transmitter Final Amplifier

The final unit (X45-360 A/2) is composed of an HF and VHF band final amplifier, an antenna turner matching circuit, and a power supply circuit.

The LPF section and antenna tuner detection circuit are located in the filter unit (X51-315).

The 1.8~144MHz band is amplified by the final unit, but it operates in the broadband up to the drive amplifier. The final unit amplifies signals using independent amplifiers in the 8~50MHz and 144MHz bands. The amplifiers are switched with a diode switch (D1).

■ Q1 : First stage amplifier

This amplifier uses a FET. It has frequency characteristics so that the gain increases in the 144MHz band.

■ Q2 : Pre-drive amplifier

This amplifier uses a bi-polar transistor. It has unique frequency characteristics.

■ Q3 and 4 : Drive amplifier

This is a push-pull type amplifier. It amplifies a signal with a broadband up to the 144MHz band, then the signal is branched to the HF and 144MHz bands through a relay.

■ Q6 and 7 : HF final amplifier

This amplifier uses a bipolar transistor with push-pull. It amplifies a signal up to the 54MHz band, using an output transformer with a coaxial cable. It outputs the signal to the LPF section through an effective and light matching circuit in the 50MHz band.

■ Q101 and 102: 144MHz final amplifier

A 144MHz band signal passes through the HPF and enters the branch circuit with two amplifiers.

It functions as a parallel amplifier that branches the signal with the same phase, amplifies it with the Q101 and 102 amplifiers and re-synthesizes it. As a result a 100W output is produced.

Since the output matching section is an LPF type, it attenuates harmonics as well. After the output has been synthesized, it detects the power of the progressive wave and reflected wave with a directional coupler according to the strip line, and outputs it to the LPF section.

■ LPF section

In the 1.8~50MHz band, the signal passes through the LPF as shown in Table 3.

It has an independent LPF circuit and an antenna changeover circuit for the 144MHz band.

The signal output from the LPF passes through the detection circuits, the transmission/reception changeover relay (K1), the antenna tuner changeover relay (K3) and the antenna changeover relay (K4) and is output to ANT1 or ANT2.

Select signal	Frequency
2M	1.8~ 2.0
4M	2.0~ 4.1
7M	4.1~ 7.5
14M	7.5~14.5
21M	14.5~21.5
28M	21.5~30.0
50M	49.0~54.0

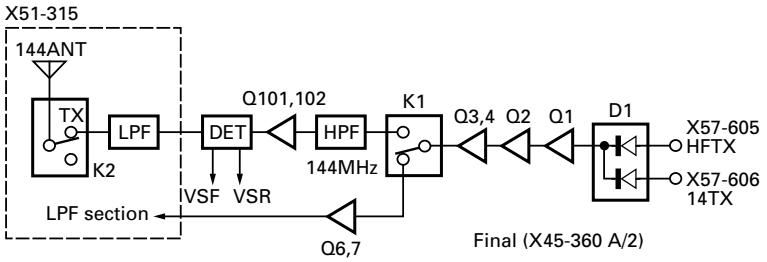

Fig. 15

CIRCUIT DESCRIPTION

■ Progressive wave and reflected wave output circuits

The signal is detected by L7, D3 and D4. A voltage output corresponding to the progressive wave and reflected wave is produced by synthesizing the magnetically combined component by L7 with the corrected electrostatically combined component by TC1 and C9 and detecting the resulting signal.

It is adjusted by TC1 so that the reflected wave voltage under a 50Ω load is minimized. VR1 adjusts the frequency characteristics in the 50MHz band.

These outputs are synthesized with detected output of the 144MHz band and are fed to the TX-RX1 unit (X57-605).

■ Antenna turner detection circuit

The passing current is converted to voltage by L9, and the voltage is stepped down and detected by L10. One of these components is buffered by Q1 and Q2 and rectified by Q3 and Q4, are input to the phase comparator (IC2) . The IC determines the IC2 Q output "H" or "L" according to the phase difference with a D-flip-flop. The other component is detected by diodes (D10 and D11) and the amplitude difference is compared with the comparator (IC1).

The capacitor capacitance on the input side is changed according to the phase difference detection output, and the capacitor capacitance on the output side is changed according to the amplitude difference detection output.

■ UHF final unit (X45-360 B/2)

The 430MHz band transmit signal output from the TX-RX2 unit (X57-606) is amplified to 50W by four amplifiers (Q901, 902, 903 and 905). The final unit consists of single amplifiers Q901, 902, 903 and 905. The input and output of the final stage is composed of micro-strip lines. The progressive wave and reflected wave detection circuit is also made of micro-strip lines and used for power control and reflected wave protection.

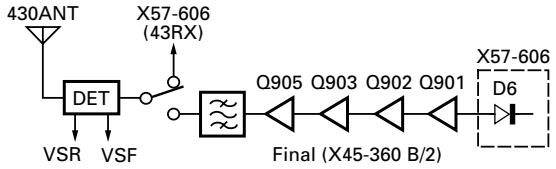

Fig. 17

1.2GHz Unit Transmitter Section

The 10.595MHz transmit signal from 12TIF is amplified in the sending IF amplifier (Q304). This signal is input into the sending mixer (Q1 and Q2).

The 135.395MHz signal converted in Q1 and 2 passes through the MCF (XF2) and IF amplifier (Q3), is input into the diode mixer (D1) and converted to 1240~1300MHz. This signal is amplified to approximately 0dB in the sending RF amplifier (IC1 and Q5), then input to IC2.

It is amplified to approximately 1W in the drive power module (IC2) and to approximately 10W in the final power module (IC3), then sent to the antenna terminal (12ANT).

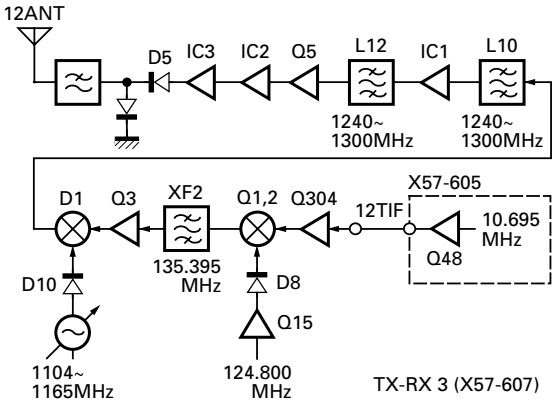

Fig. 18

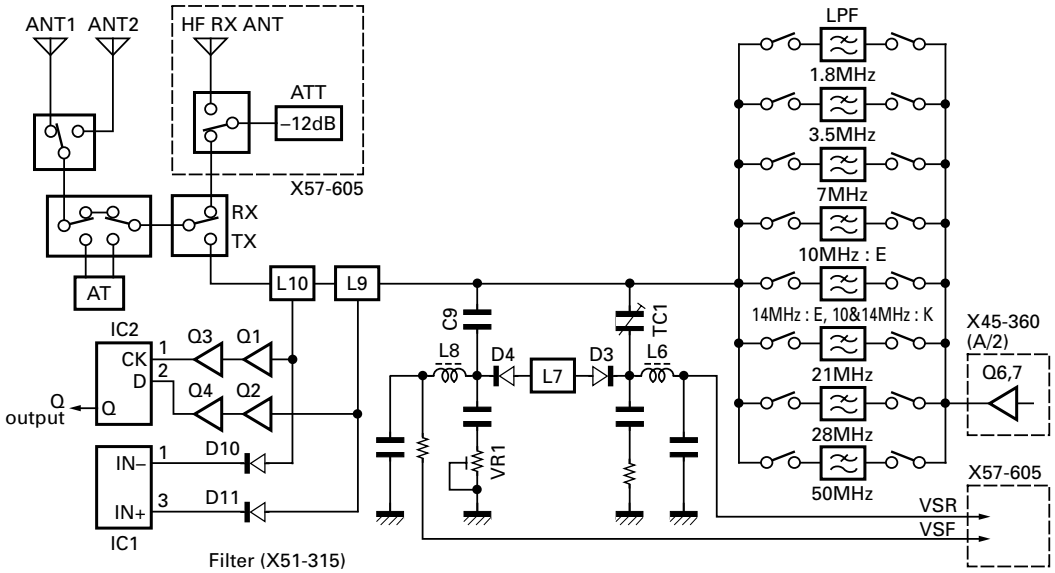

Fig. 16

CIRCUIT DESCRIPTION

Digital Control Circuit

■ Outline

The TS-2000/X control circuit has a multi-chip configuration centered around a main microcomputer (IC8), and contains a latch circuit for input/ output, a TNC and a DSP. Refer to the digital control block diagram.

■ Main microcomputer peripherals

Four serial communication devices utilizing a UART function (panel microcomputer, TNC, mobile head and PC serial port) are connected to the main microcomputer. An EEPROM (IC7) for backup and a DTMF decoder (IC12) for DTMF signal detection are also connected to the microcomputer.

The input/output circuit and DSP are connected through an address bus and a data bus. The bus to the DSP is connected through 5V ↔ 3V voltage conversion ICs (IC9, IC10, and IC11)

The microcomputer operates with an internal core voltage of 3.3V, an external I/O voltage of 5V and an internal frequency of 22.1184MHz (11.0592MHz x 2).

■ TNC

The TNC is the same as the one used in the TH-D7. The TNC uses a lithium battery to back up various settings. When a 9600bps communication speed is used, the TNC analog signal is connected directly to the transmitter/receiver circuit without passing through the DSP.

■ Input/output latch circuit

A latch IC is used in stead of several input/output ports. Since the latch IC has a latch function only, the latch circuit contains an input latch logic circuit (IC13, IC14, IC15) and an output latch logic circuit (IC16, IC17, IC18) to generate the signals required for the latch IC using the main microcomputer's address bus information. This configuration is also used for the latch IC of the DSP section.

■ Other peripheral circuits

The main microcomputer is connected with other peripheral circuits, such as a reset circuit that generates a reset signal, a reduced voltage detection circuit that detects reduced voltage and generates a reduced voltage signal, and an over-voltage detection circuit that detects over-voltage and generates an over-voltage signal.

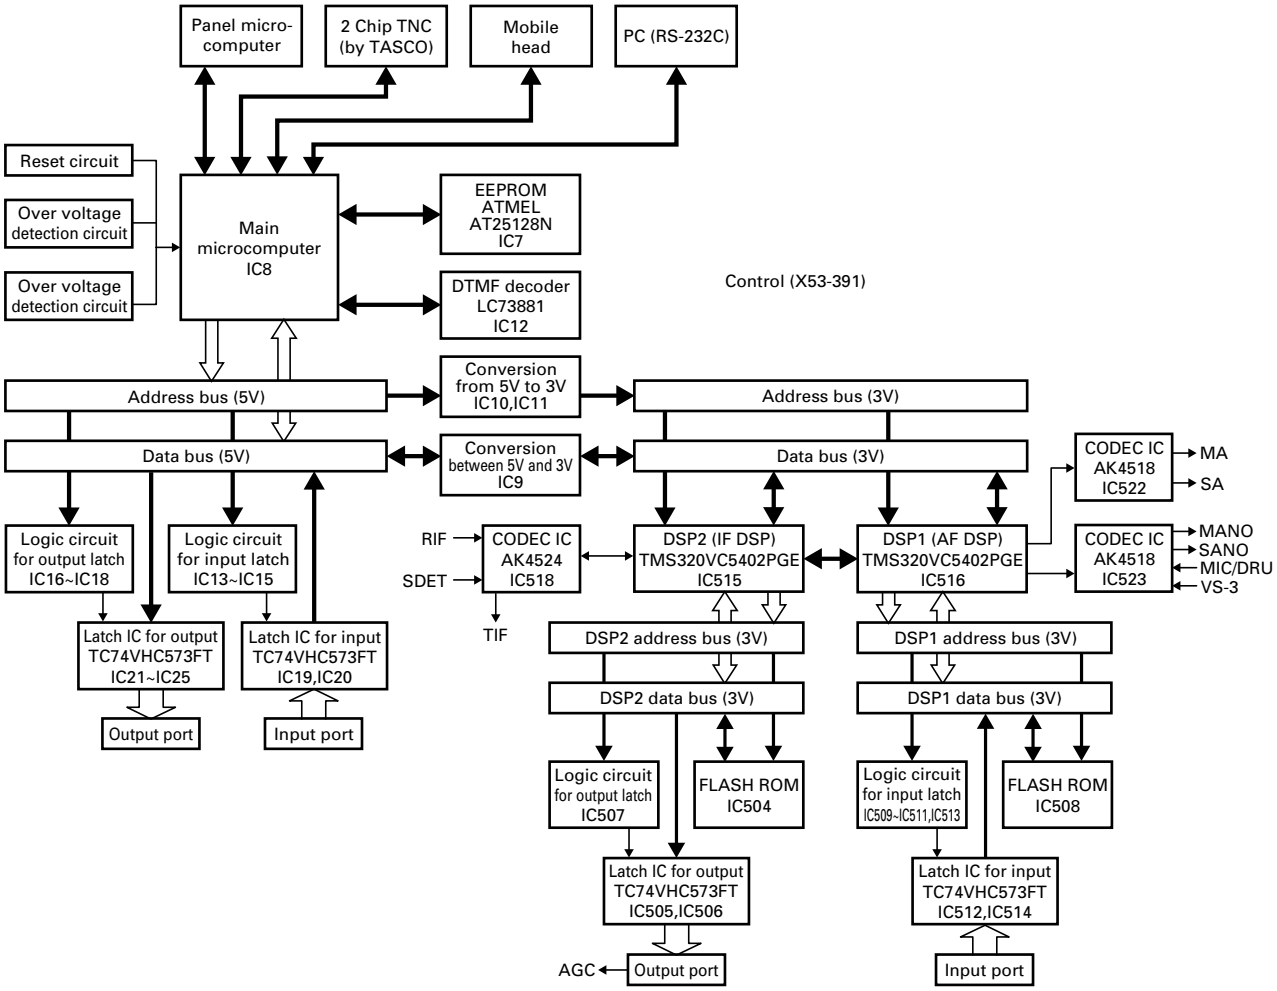

Fig. 19 Digital control block diagram

CIRCUIT DESCRIPTION

■ Firmware

The main microcomputer firmware includes adjustment firmware and user firmware. When repairs or adjustments are made in service, the user firmware must be rewritten to make adjustment firmware. It must be restored to the original user firmware after repairs or adjustments. The adjustment firmware provides a warning display and a warning sound when the power goes on.

DSP Circuit

■ Outline

The TS-2000/X DSP circuit is composed of two DSPs (IC515 and IC516) and CODEC ICs (IC518, IC522 and IC523), an input latch circuit, flash ROM (IC504 and IC508). It is connected with the main microcomputer (IC8) by an address bus and a data bus through the voltage conversion ICs (IC9, ID10 and IC11). The SSB, CW, AM and FSK detection, modulation and AGC operation are done by the DSP, and digital processing (digital filtering, noise reduction, etc.) is performed in all modes.

■ DSP

The DSP operates with an internal core voltage of 1.8V, an external I/O voltage of 3.3V and an internal frequency of 99.5328MHz (11.0592MHz x 9).

The two DSPs perform the respective IF processing and AF processing. The IF processing is done by DSP2 (IC515) and a 24 bit CODEC IC (IC518) is connected to it. DSP2 performs detection, modulation, AGC processing and IF digital filtering. It is designed so it does not exceed the processing time, even if the main band transmission and reception and sub-band reception are done simultaneously. An output latch circuit is connected to DSP2 to convert the analog AGC voltage signal from digital to analog before output. The conversion is done by the ladder resistance method.

The AF processing is done by DSP1 (IC516) and a 16 bit CODEC IC (IC522, IC523) is connected to it. DSP1 performs the speech processing (signaling generation, detection, noise reduction, speech filtering, and various volume processing). The input latch circuit is connected to DSP1 and various signals from the main microcomputer and the microphone selection signal are input into it.

■ Flash ROM

The respective programs and data are stored in the Flash ROM (IC508 and IC504) connected to DSP1 and DSP2.

■ CODEC IC

A 24 bit CODEC IC (IC518) is used as the IF signal system. DSP2 carries out 32 bit digital processing for detection and modulation. The operation of this IC is controlled by the main microcomputer.

Two 16 bit CODEC ICs (IC522 and IC523) are used as the AF signal system. These IC outputs directly enter the AF amplifier, are amplified and then output from the speaker. The IC input consists of the MIC input and the optional speech synthesis unit (VS-3).

The various timing signals required by both CODEC ICs are generated and supplied by a 12.288MHz quartz crystal and a peripheral circuit.

■ Communication between DSPs

DSP1 and DSP2 are connected via serial communication and perform such interchanges as audio signals for transmission processed in DSP1, received speech signals detected in DSP2 and information from the DSP1 input latch circuit. If this interchange does not go well when the power starts up, a "DSP COMM" error will be displayed on the LCD and the fact that the DSPS is not operating will be notified to the main microcomputer. Likewise, when the content of the flash ROM is abnormal, a "DSP COMM" error is displayed.

DESCRIPTION OF COMPONENTS

FINAL UNIT (HF) (X45-360X-XX) (A/2)

Ref. No.	Use / Function	Operation / Condition
Q1,2	Predrive amplifier	HF/VHF band amplifier
Q3,4	Drive amplifier	HF/VHF band push-pull wide-band amplifier
Q6,7	Final amplifier	HF/50MHz band push-pull wide-band amplifier
Q8	Bias control	HF/50MHz band final stage bias current control
Q101,102	Final amplifier	VHF band push-pull wide-band amplifier
Q103	Bias control	VHF band final stage bias current control
Q201	Switching	ANT1 and ANT2 changeover relay control

Q9,10	Switching	
Q13	Buffer amplifier	9600 bps RX signal
Q14	Buffer amplifier	1200 bps RX signal
Q15,16	Amplifier	Waveform shaping of TNC TX signal
Q17	Switching	Backup processing control of panel microcomputer
Q18	Switching	RS-232C related power source (X57-605 A/9)
Q19,20	Switching	
Q501	Switching	
IC1	Reset IC	For main microcomputer
IC2	AVR	Digital system 5V generation
IC3	AVR	5V constantly on
IC4	3.3V AVR for DSP	3.3V
IC5,6	Analog switch	Main microcomputer ADC input changeover
IC7	EEPROM	For storage of various set values
IC8	Main microcomputer	Primary main unit operation
IC9	Conversion between 5V and 3V	Two-way conversion
IC10,11	Conversion from 5V to 3V	Main microcomputer and DSP data conversion
IC12	DTMF decoder IC	For DTMF decoding
IC13~18	Input/output port logic	Logic of latch IC used as input/ output port
IC19,20	Input port	Used as input port for main micro-computer
IC21~25	Output port	Used as output port for main micro-computer
IC26	TNC microcomputer	Dedicated TNC microcomputer
IC27	OP amplifier	A/2 : 1200 bps RX AF amplifier B/2 : 9600 bps RX AF amplifier
IC28	TNC logic circuit	TNC logic
IC29	OP amplifier	A/2 : 1200 bps RX AF amplifier B/2 : 9600 bps RX AF amplifier

Ref. No.	Use / Function	Operation / Condition
IC30	Comparator	Waveform shaping of modem TX signal
IC31	AND	Sends DSP1 and DSP2 WAIT signal to CPU through AND circuit
IC32,33	Reset IC	
IC501	AVR	3V within control
IC502,503	1.8V AVR for DSP	1.8V
IC504	Flash ROM for DSP2	For program and coefficient storage
IC505,506	For DSP port output	Used as output port (AGC output)
IC507	Input/output port logic	Logic of latch IC used as input/ output port
IC508	Flash ROM for DSP1	For program and coefficient storage
IC509	Input/output port logic	Logic of latch IC used as input/ output port
IC510	Input/output port logic	
IC511	Input/output port logic	Logic of latch IC used as input/ output port
IC512	For DSP port input	Used as input port
IC513	Input/output port logic	Logic of latch IC used as input/ output port
IC514	For DSP port input	Used as input port
IC515	DSP	For IF processing
IC516	DSP	For AF processing
IC517	Analog AGC buffer	Analog AGC voltage buffer
IC518	CODEC (24 bit)	RIF input, TIF output
IC519,520	For CODEC clock division	
IC521	For CODEC clock division	Operation at 12.288MHz frequency
IC522,523	CODEC (16 bit)	Microphone input, AF output
IC524~529	Buffer for analog signal input/output	Connection to CODEC input/output
IC530	Serial/parallel	For microphone input changeover
IC531~534	Analog switch	For input/output changeover
IC535	Buffer for analog signal input/output	Connection to CODEC input/output
D5,6	Reverse current prevention	
D11,12	Reverse current prevention	
D13	Reference voltage source	
D14~17	Reverse current prevention	
D501~504	Reverse current prevention	

DESCRIPTION OF COMPONENTS

DISPLAY UNIT (X54-3320-00)

Ref. No.	Use / Function	Operation / Condition
Q1~3	AVR	LCD backlight
IC1	LCD driver	LCD 7-segment driver (B-SEG)
IC2	LCD driver	LCD 7-segment driver (A-SEG)
IC3	LCD driver	LCD dot segment driver
IC4	Serial/parallel	LED control, backlight dimmer control
D1	LED	On when VOX is selected
D2	LED	On when PROC is selected
D3~9	LED	Key illumination

TX-RX 1 UNIT (X57-605X-XX)

Ref. No.	Use / Function	Operation / Condition
Q1	RF mute	On in HF/50MHz TX mode
Q2	Switching	On in HF/50MHz RX mode
Q3	Switching	Q2 control
Q4	Switching	Dedicated external RX antenna changeover relay control
Q5	Switching	HF/50MHz RF ATT control
Q6	Switching	On in 50MHz TX mode
Q7~10	RX 1st mixer	RX 1st IF 69.085/75.925MHz
Q11	Switching	Off when HF/50MHz preamplifier on
Q12	RF amplifier	When HF-21.5MHz
Q13	Amplifier	1st local oscillation amplifier
Q14,15	Switching	Q12 control
Q16,17	Switching	Q16 turns on when first IF change-over control is 75.925MHz
Q18	Amplifier	RX 1st IF 69.085/75.925MHz
Q19,20	RX 2nd mixer	Converts RX 1st IF to 10.695MHz
Q21	Switching	Reserved
Q22	Amplifier	For NB 10.695MHz
Q25	Amplifier	RX 2nd IF amplifier 10.695MHz
Q26	Amplifier	NB amplifier 10.695MHz
Q27	DC amplifier	NB AGC amplifier
Q28	Amplifier	NB amplifier 10.695MHz
Q29	Switching	On at time of NB blanking
Q30	Buffer amplifier	Impedance changeover
Q31	Switching	On at time of NB blanking
Q32	Amplifier	RX 3rd local oscillation amplifier (11.150MHz)
Q33	Switching	On when 1st IF frequency is 69.085MHz
Q34	Switching	Creates RXB in FM mode
Q37	Switching	Creates RXB in non-FM mode
Q38	Amplifier	3rd IF amplifier (455kHz)
Q40	Switching	On during RX in non-FM mode
Q41	Amplifier	RX 4th local oscillation amplifier (467kHz)
Q42	Buffer amplifier	4th IF frequency (12kHz)
Q43	Amplifier	HF/50MHz TX drive amplifier
Q44,45	TX 3rd mixer	Converts 68.985/75.825MHz to TX frequency
Q46,47	TX 2nd mixer	Converts 10.695MHz to 68.985/75.825MHz
Q48	Buffer amplifier	10.695MHz
Q49	TX 2nd IF amplifier	10.695MHz
Q51	Switching	Keying control
Q52	DC buffer amplifier	ALC keying control
Q53	Switching	On during TX in non-FM mode
Q54	TX 2nd IF amplifier	10.695MHz
Q57	Switching	On during transmission in FM mode
Q58	Limiter	FM modulation signal limiter (elimination of AM component)
Q59	Oscillator	FM oscillator, modulation 10.595MHz
Q60	Switching	On during TX in non-FM mode
Q61,62	Mute	On when main and sub are simultaneously AF muted
Q63,64	DC-DC oscillator	–6V generation
Q65	Switching	On when relay for HF band linear is used
Q66	Switching	On when relay for HF band linear is transmission
Q67	Switching	On when relay for HF band linear is used
Q69,70	AVR	AVR for mobile controller (Power about 9.4V)
Q71,72	Switching	50MHz/VHF/UHF/1.2GHz band external linear control
Q73,74	Amplifier	ALC amplifier
Q75	Switching	On in AM mode, makes it an average value type ALC
Q76	Amplifier	ALC amplifier
Q77	Switching	Turns on and lowers the power at time of protection
Q78,79	Amplifier	ALC amplifier
Q80~91	Switching	Produces the respective TXB and RXB from 8C to HF/50MHz, VHF band, UHF band and 1.2GHz bands. The synthesis of the TXB becomes IF TXB and the synthesis of the RXB becomes IF RXB. This control voltage is necessary for simultaneous TX/RX, such as for satellite communication.
Q92	Switching	Cancels the time constant for VSF and VSR voltage lines during antenna tuning
Q93	Buffer amplifier	Buffer amplifier for external modulation input signal

DESCRIPTION OF COMPONENTS

Ref. No.	Use / Function	Operation / Condition
Q94,95	Buffer amplifier	Buffer amplifier for ANO output of main and sub band
Q96	Switching	External squelch output of main and sub bands (open collector)
Q97	DC buffer amplifier	Ripple filter for AF IC (IC9) power supply
Q101~112	Switching	On when RF BPF SW is selected
Q601	Amplifier	31.2MHz
Q602	Buffer amplifier	RX 4th local oscillator (467kHz)
Q603	Amplifier	31.2MHz
Q604	Buffer amplifier	TX 1st oscillator (10.595MHz)
Q605	Amplifier	31.2MHz
Q606	Buffer amplifier	RX 3rd local oscillator (11.150MHz)
Q607,608	Switching	On when 1st IF frequency is 69.085MHz
Q609	Switching	DC switch
Q700,701	Mixer	RX 3rd mixer and 3rd IF frequency (455kHz)
Q702	Switching	Gain correction, on when RX 1st IF is 69.085MHz
Q703	Switching	L69 tuning correction, on when RX 1st IF is 69.085MHz
Q704	Switching	On during TX in FM mode
Q705	Amplifier	On RF amplifier is 21.5~60MHz
Q706~708	Switching	On at time of Q705 operation
Q709	Buffer amplifier	455kHz
Q710	Amplifier	Squelch noise amplifier
Q711	TX 2nd IF amplifier	10.695MHz
Q712,714	Switching	On during TX in FM mode
Q715	Amplifier	DRU output amplifier
Q800	Switching	On when FUNC switch is selected
Q801	AVR	For LED
Q802	Switching	On in main band TX mode
Q803	AVR	For LED
Q804	Switching	On when main band BSY
Q805	AVR	For LED
Q806	Switching	On in sub band TX mode
Q808	Switching	On when sub band BUSY
Q811	Switching	On when modem 9600 bps is selected
Q813	Switching	On when modem STA is active
Q815	Switching	On when a modem is connected
Q817	Switching	On when MULTI ENC is sctive
Q819	Switching	On when sub receiver is on
Q820,822	Switching	On when key illumination is on
Q951	Switching	Reset control
IC1	FM IF	IF amplifier, Squelch
IC2	OP amplifier	A/2 : ALT voltage buffer B/2 : FM AF amplifier
IC3	Mixer	RX 4th mixer (Output : 12kHz)

Ref. No.	Use / Function	Operation / Condition
IC4	OP amplifier	A/2 : Unused B/2 : AGC reference voltage buffer
IC5	Extended I/O	RF BPF changeover control
IC6	Mixer	TX 1st mixer (Output : 10.595MHz)
IC7	Multiplexer	Receiver output, FM (AF) and non-FM (IF) changeover
IC8	Analog switch	Modulation input, FM (AF), non-FM (IF) and packet (AF) changeover
IC9	AF PA	Main and sub 2 channels
IC10	Level converter	RS-232C level and 5V conversion
IC11	Buffer amplifier	Voltage buffer
IC12	OP amplifier	1/4 : TX power gain control voltage buffer 2/4 : Unused 3/4 : RX IF gain control voltage buffer 4/4 : TX band gain control voltage buffer
IC13	OP amplifier	A/2 : ALC reference voltage buffer B/2 : ALC meter voltage buffer
IC14	DAC	1/8 : TX power control voltage 2/8 : ALC reference voltage 3/8 : Unused 4/8 : Protection voltage 5/8 : TX power gain control voltage 6/8 : Unused 7/8 : TX band gain control voltage 8/8 : RX IF gain control voltage
IC15	DAC	1/8 : HF/50MHz TX BPF control voltage 2/8 : RF unit RX sub BPF control voltage 3/8 : RF unit RX main BPF control voltage 4/8 : RF unit TX UHF BPF control voltage 5/8 : H in non-FM mode 6/8 : Unused 7/8 : Unused 8/8 : NB level control voltage
IC16	Extended I/O	Q0 : L when RX 10.695MHz XF5 is selected Q1 : L when RX 10.695MHz XF6 is selected Q2 : L when RX 10.695MHz through is selected Q3 : L when AT tuning Q4 : L when RX 455kHz CF1 is selected Q5 : L when RX 455kHz CF2 is selected Q6 : L when RX 455kHz CF3 is selected Q7 : Reserved Q8 : Reserved Q9 : Unused Q10 : H when main squelch is open Q11 : H when sub squelch is open

DESCRIPTION OF COMPONENTS

Ref. No.	Use / Function	Operation / Condition
IC17	Extended I/O	Q0 : H when UHF ATT is on Q1 : H when VHF ATT is on Q2 : H when HF/50MHz ATT is on Q3 : L when external RX antenna terminal is selected Q4 : L when HF/50MHz preamplifier is selected Q5 : H when RX 1st IF 75.925MHz is selected Q6 : H during AM TX Q7 : H during TX in PKD and 9600 bps is selected Q8 : H during TX in non-FM mode Q9 : H during RX in non-FM mode Q10 : H when linear amplifier usage is selected in HF or 50MHz band Q11 : H when linear amplifier usage is selected in either band
IC18	OP amplifier	A/2 : 5V voltage source B/2 : Amplifier 455kHz
IC19	OP amplifier	A/2 : VSR voltage amplifier B/2 : VSF voltage amplifier
IC601	DDS	RX 4th local oscillator (467kHz)
IC602	DDS	TX 1st local oscillator (10.595MHz)
IC603	DDS	RX 3rd local oscillator (11.150MHz)
IC604	Inverter	Polarity inversion
IC605	AVR	14S→8V
IC801	CPU	Display microcomputer
D1	Surge absorption	Relay (K1)
D2	Surge absorption	External RX antenna terminal
D3	Surge absorption	Relay (K2)
D4~6	Surge absorption	Internal circuit protection
D7	Switching	RX/TX changeover, on during RX
D8	Switching	On when RF BPF under 1.705MHz is selected
D9	Surge absorption	Internal circuit protection
D10	Switching	On when RF BPF under 1.705MHz is selected
D11	Switching	On when RF BPF over 1.705MHz is selected
D12,13	Switching	On when RF BPF of 1.705~2.5MHz is selected
D14,15	Switching	On when RF BPF of 2.5~4.1MHz is selected
D16,17	Switching	On when RF BPF of 4.1~6.9MHz is selected
D18,19	Switching	On when RF BPF of 6.9~7.5MHz is selected

Ref. No.	Use / Function	Operation / Condition
D20,21	Switching	On when RF BPF of 7.5~10.5MHz is selected
D22,23	Switching	On when RF BPF of 10.5~13.9MHz is selected
D24,25	Switching	On when RF BPF of 13.9~14.5MHz is selected
D26	Switching	RX/TX changeover, on during TX
D27,28	Switching	On when RF BPF of 14.5~21.5MHz is selected
D29,30	Switching	On when RF BPF of 21.5~30MHz is selected
D31,32	Switching	On when RF BOF of 30~49MHz and 54~60MHz is selected
D33,34	Switching	On when RF BPF of 49~54MHz is selected
D35,36	Switching	On when ~60MHz preamplifier is on
D38,39	Switching	On when ~21.5MHz preamplifier is on
D40	Switching	HF/50MHz LO1 TX/RX changeover
D41,42	Switching	RX 1st MCF changeover
D45	Switching	HF/50MHz LO2 changeover
D46	Switching	HF/50MHz and VHF/UHF band RX IF input changeover, 10.695MHz
D47	Switching	1.2GHz RX IF input changeover, 10.695MHz
D48	Reverse current prevention	Main RBK and NB mute signal matching, main side mute when on
D49	Switching	10.695MHz IF filter changeover, on when wide (6kHz) is selected
D50	Switching	10.695MHz IF filter changeover, on when narrow (2.7kHz) is selected
D52	Switching	10.695MHz IF filter changeover, on when through is selected
D53	Switching	10.695MHz IF filter changeover, on when narrow (2.7kHz) is selected
D55	Switching	10.695MHz IF filter changeover, on when wide (6kHz) is selected
D56	Switching	10.695MHz IF filter changeover, on when through is selected
D57	Switching	10.695MHz IF filter changeover, on when wide (6kHz) is selected
D58	Switching	10.695MHz IF filter changeover, on when narrow (2.7kHz) is selected
D60	Switching	10.695MHz IF filter changeover, on when through is selected
D61	Switching	10.695MHz IF filter changeover, on when wide (6kHz) is selected
D62	Switching	10.695MHz IF filter changeover, on when narrow (2.7kHz) is selected

DESCRIPTION OF COMPONENTS

Ref. No.	Use / Function	Operation / Condition
D64	Switching	10.695MHz IF filter changeover, on when through is selected
D65	Reverse current prevention	Matching of main VHF and main UHF changeover signal
D66	Detection	NB switching pulse detection
D67	Switching	455kHz IF filter changeover
D68	Switching	On when FM mode is selected in main band
D69	Switching	455kHz IF filter changeover
D70,71	Switching	455kHz IF filter changeover
D73	Switching	On when non-FM mode is selected in main band
D75	Switching	On during HF/50MHz TX
D76~79	Variable capacitor	Voltage varies (2 stages) according to the TX band
D80	Switching	TX IF output HF/50MHz, VHF/UHF changeover
D81	Switching	TX IF output 1.2GHz changeover
D82	PIN diode	TX IF gain variable according to TX power
D83	Reverse current prevention	Matching of VTXB and UTXB
D84	PIN diode	TX gain setting of each band
D85	Reverse current prevention	
D86	LED	For constant voltage
D87~89	Reverse current prevention	
D90	Switching	TX IF FM mode/non-FM mode changeover, 10.595MHz
D91	Variable capacitor	FM modulation 10.595MHz
D92,93	Reverse current prevention	Creates IF TXB
D94,95	Reverse current prevention	Creates IF RXB
D96	Zener diode	Stabilizes minus power source to –6V
D97	Rectifier	Creates minus voltage
D98	Surge absorption	Relay (K3)
D99	Reverse current prevention	Matching of start signals from PC and mobile panel
D100	Zener diode	Port protection
D101	Poly-switch	Over voltage detection
D102	Zener diode	Reference voltage of constant voltage power source for mobile panel
D103,104	Surge absorption	
D105	LED	Creates reference voltage
D106	Reverse current prevention	External ALC matching
D107	Zener diode	External ALC voltage shift

Ref. No.	Use / Function	Operation / Condition
D108	Zener diode	Voltage shift
D109,110	Reverse current prevention	External ALC matching
D111	Reverse current prevention	
D112	Zener diode	Port protection
D113	Zener diode	Voltage shift, lower power when power voltage drops
D114	Zener diode	Set so the power does not to rise when the power voltage goes up
D115,116	Reverse current prevention	Meter line
D117,118	Reverse current prevention	External standby
D119	Reverse current prevention	UHF forward wave
D120	Reverse current prevention	UHF reflected wave
D121	Reverse current prevention	1.2GHz forward wave
D122	Reverse current prevention	1.2GHz reflected wave
D123	Reverse current prevention	VHF forward wave
D124	Reverse current prevention	VHF reflected wave
D130	PIN diode	RX gain adjustment 455kHz
D700~702	Reverse current prevention	
D703	Variable capacitor	Voltage varies (2 stages) according to the TX band
D704,705	Switching	On when preamplifier is on at 21.5~60MHz
D706	Reverse current prevention	On at 21.5~60MHz
D707	Rectifier	Noise rectification for FM squelch
D708	Reverse current prevention	Leak current prevention
D709	Zener diode	8V→5V
D710	Voltage shift	Temperature compensation
D711	Reverse current prevention	Discharge path (non-FM mode)
D712,713	Cliper	External modulation input
D714	Voltage shift	
D715	Variable capacitor	Voltage varies (2 stages) according to the TX band
D716	Reverse current prevention	

DESCRIPTION OF COMPONENTS

Ref. No.	Use / Function	Operation / Condition
D717	Surge protection	
D719,720	Zener diode	External surge voltage protection
D721	Reverse current prevention	
D801	LED	On in main band TX mode
D802	LED	On when main band BSY
D803	LED	On in sub band TX mode
D804	LED	On when sub band BSY
D805~809	Reverse connection prevention	Key matrix
D810~824	LED	Key illumination
D826~834	LED	Key illumination
D825	LED	On when FUNC switch is selected
D950~952	Reverse current prevention	
D953	LED	On when TNC 9600 bps is selected
D954	LED	TNC TX buffer state display
D955	LED	TNC connection state display
D956	LED	On when MULTI is selected
D957	LED	Lights when the sub is on

TX-RX 2 UNIT (X57-606X-XX)

Ref. No.	Use / Function	Operation / Condition
Q1	Switching	UHF RX ATT control
Q2	Switching	VHF RX ATT control
Q3	Switching	Sub band local oscillator power supply
Q11	Switching	VHF RX power supply
Q13	Switching	UHF power supply
Q14	Amplifier	UHF preamplifier
Q15	Amplifier	VHF preamplifier
Q16	Switching	UHF RX power supply
Q17	Amplifier	UHF TX signal amplification
Q18	Amplifier	VHF TX signal amplification
Q19	Amplifier	UHF RX signal amplification
Q20	Amplifier	VHF TX signal amplification
Q21	Amplifier	UHF main RX signal amplification
Q22,23	Amplifier	VHF sub RX signal amplification
Q24	Amplifier	VHF main RX signal amplification
Q25	Amplifier	VHF sub RX signal amplification
Q26	Amplifier	UHF TX signal amplification
Q30	Amplifier	Main RX local oscillator signal amplification
Q31	Switching	Main RX mixer power supply
Q32	Amplifier	VHF sub RX local oscillator signal amplification
Q33	Amplifier	UHF sub RX local oscillator signal amplification
Q34	Amplifier	VHF/UHF TX local oscillator signal amplification
Q35	Switching	Sub RX AM power supply
Q36	Switching	VHF sub RX IC6 power supply
Q37	Amplifier	Sub RX 1st IF signal amplification
Q38	Amplifier	Main RX 1st IF signal AGC control amplification
Q39	DC amplifier	Sub RX AM AGC control signal DC amplification
Q40,41	Switching	Sub RX FM wide/narrow change-over control
Q42,43	Mixer	Main RX 2nd mixer
Q44	Amplifier	Main RX 2nd mixer local oscillator signal amplification
Q45	Amplifier	Sub RX AM signal amplification
Q46,47	Mixer	TX mixer
Q48	Amplifier	Sub RX AM signal amplification
Q50	Amplifier	TX mixer local oscillator signal amplification
Q51	Amplifier	Sub RX AM signal amplification
Q55	Switching	VHF sub RX power supply
Q56	Switching	UHF sub RX power supply
Q57	Switching	Sub RX IF amplifier gain RBK control
Q58	Switching	VHF main RX preamplifier through
Q59	Switching	UHF main RX preamplifier through
Q60	Switching	VHF/UHF TX wide-band amplifier power supply
Q61	Amplifier	Main RX 2nd IF signal amplification
Q62	Switching	VHF/UHF TX wide-band amplifier power supply
Q63	Amplifier	Sub RX squelch signal noise amplification
Q65	Amplifier	31.2MHz reference signal amplification
Q66,67	Switching	Sub RX band changeover control
Q400~402	Active LPF	Comparison frequency 5kHz
Q403	Switching	HF LO2 VCO changeover
Q404	Switching	Sub VCO1 oscillation frequency changeover
Q405	Switching	Sub VCO2 oscillation frequency changeover
Q406	SUB VCO1	322.950~426.040MHz (K) 371.475~381.475MHz (E)
Q407	SUB VCO2	354.950~465.050MHz (K) 405.050~409.050MHz (E)
Q409	LO2 VCO	58.390~65.230MHz
Q410	Switching	Sub VCO1 changeover
Q411	Switching	Sub VCO2 changeover
Q412	Doubler	15.6MHz x 2 = 31.2MHz
Q413	Amplifier	For sub VCO1 (322.950~426.040MHz (K) 371.475~381.475MHz (E))
Q414	Amplifier	For sub VCO2 (354.950~465.050MHz (K) 405.050~409.050MHz (E))

DESCRIPTION OF COMPONENTS

Ref. No.	Use / Function	Operation / Condition
Q415	Buffer amplifier	For HF LO2 (58.390~65.230MHz)
Q416	Buffer amplifier	PLL input buffer (322.950~465.050MHz (K) 371.475~409.050MHz (E))
Q417	Amplifier	For VHF/UHF LO2 (31.2MHz)
Q418,419	Ripple filter	8V
Q420	Buffer amplifier	15.6MHz
Q421	Amplifier	For HF LO2 output (58.390~65.230MHz)
Q423~425	Buffer amplifier	DDS input buffer (31.2MHz)
Q426	Switching	For Q427
Q427	HF REF VCO	31.130~32.834MHz
Q428	Amplifier	For HF REF VCO (31.130~32.834MHz)
Q429	Buffer amplifier	For VHF DDS (9.014~9.322MHz (K) 9.112~9.210MHz (E))
Q430	Buffer amplifier	For UHF DDS (8.328~8.475MHz (K) 8.344~8.469MHz (E))
Q431	UHF VCO	378.105~418.205MHz (K) 388.105~398.205MHz (E)
Q432	Buffer amplifier	For HF DDS (7.792~8.209MHz)
Q433	VHF VCO	183.795~193.895MHz (K) 185.795~187.895MHz (E)
Q434	Switching	UHF VCO changeover
Q435	Amplifier	For UHF VCO (378.105~418.205MHz (K) 388.105~398.205MHz (E))
Q436	Ripple filter	8V
Q437	Amplifier	For VHF VCO (183.795~193.895MHz (K) 185.795~187.895MHz (E))
Q438	Ripple filter	8V
Q489	Switching	VHF REF VCO changeover
Q441	VHF REF VCO	36.058~37.288MHz
Q444	Amplifier	For VHF REF VCO (36.058~37.288MHz)
Q446	Ripple filter	8V
Q447	Active LPF	Comparison 975~1375kHz
Q448,449	Active LPF	Comparison 520~529kHz
Q450	Active LPF	Comparison 975~1375kHz
Q451	Active LPF	Comparison 520~529kHz
Q452	Active LPF	Comparison 975~1375kHz
Q453	Switching	HF VCO1 changeover
Q454	switching	HF VCO3 changeover
Q455	Ripple filter	8V
Q457	Amplifier	For PLL input (183.795~193.895MHz (K) 185.795~187.895MHz (E))
Q458	Ripple filter	8V
Q459	HFLO1, VCO1	75.855~86.085MHz
Q460	HFLO1, VCO3	112.825~129.085MHz

Ref. No.	Use / Function	Operation / Condition
Q461	Amplifier	For PLL input (378.105~418.205MHz (K) 388.105~398.205MHz (E))
Q462	Amplifier	For HF VCO (75.855~129.085MHz)
Q463	Switching	HF VCO2 changeover
Q464	HFLO1, VCO2	92.825~106.085MHz
Q469~472	Switching	VHF/UHF LO1 output changeover
Q473	Ripple filter	8V
Q474	Switching	VHF/UHF LO1 output changeover
Q476	Amplifier	For HF LO1 output
IC2	Serial/parallel signal conversion	Power, AM FM wide/narrow control
IC3	Wide-band amplifier	VHF/UHF TX amplifier
IC4	Mixer	Main RX 1st mixer
IC5	Mixer	Sub RX 1st mixer
IC6	Divider	Sub VHF local oscillator 1/2 divider
IC7	FM IC	Sub band FM detection
IC8	Multiplexer	Sub band FM/AM audio output changeover
IC9	OP amplifier	Sub band FM demodulated signal amplification
IC400	AVR	10V→8V
IC401	PLL	For HF LO2 VCO
IC402	PLL	For sub VCO
IC403	AVR	8V→5V
IC404	Serial/parelle conversion	VCO changeover signal output
IC405	Wide-band amplifier	For sub LO1 output (322.950~ 465.050MHz (K) 371.475~405.050MHz (E))
IC406	DDS	For VHF REF VCO (9.014~9.322MHz (K) 9.112~9.210MHz (E))
IC407	DDS	For UHF VCO (8.328~8.476MHz (K) 8.344~8.469MHz (E))
IC408	DDS	For HF REF VCO (7.792~8.209MHz)
IC409	PLL	For HF REF VCO
IC410	PLL	For VHF VCO
IC411	PLL	For VHF REF VCO
IC412	PLL	For UHF VCO
IC414	PLL	For HF VCO
IC415	Wide-band amplifier	For VHF/UHF RX LO1 output (183.895~418.105MHz (K) 185.895~398.105MHz (E))
IC416	Wide-band amplifier	For VHF/UHF TX LO1 output (183.795~418.205MHz (K) 185.795~398.205MHz (E))
D6	Switching	On in UHF TX mode
D7	Switching	On in VHF TX mode

DESCRIPTION OF COMPONENTS

Ref. No.	Use / Function	Operation / Condition
D9	Switching	On when UHF RX preamplifier is on
D10	Switching	On when VHF RX preamplifier is on
D11	Switching	On when UHF RX preamplifier is off
D12	Switching	On when UHF RX ATT is on
D13	Switching	On when VHF RX preamplifier is off
D14	Switching	On when VHF RX ATT is on
D15	Switching	On when VHF RX preamplifier is off
D16	Switching	On when VHF RX ATT is off
D17	Switching	On when UHF RX preamplifier is off
D18	Switching	On when UHF RX ATT is off
D19	Switching	On in UHF TX mode
D20	Switching	On when UHF RX preamplifier is on
D21	Switching	On in VHF TX mode
D22	Switching	On when VHF RX preamplifier is on
D23	Switching	On when UHF is selected in the main band
D24	Switching	On when VHF is selected in the main band
D30	Variable capacitor	VHF main RX BPF tuning
D31	Variable capacitor	UHF main RX BPF tuning
D32	Variable capacitor	VHF sub RX BPF tuning
D33	Variable capacitor	UHF TX BPF tuning
D34	Variable capacitor	VHF main RX BPF tuning
D36	Variable capacitor	UHF main RX BPF tuning
D37	Variable capacitor	VHF sub RX BPF tuning
D39	Variable capacitor	VHF main RX BPF tuning
D40	Variable capacitor	VHF sub RX BPF tuning
D41	Variable capacitor	VHF main RX BPF tuning
D42	Variable capacitor	UHF TX BPF tuning
D43	Variable capacitor	UHF main RX BPF tuning
D46	Switching	On in VHF sub RX
D47	Variable capacitor	UHF TX BPF tuning
D48	Switching	On when VHF is selected in the main band
D49	Switching	On when UHF is selected in the main band
D51	Variable capacitor	UHF TX BPF tuning
D52	Switching	VHF/UHF TX BPF selection
D53,56	Switching	VHF/UHF sub local oscillator changeover
D54	Diode mixer	VHF/UHF TX mixer
D57	Switching	Wide/narrow switching
D58	AM detector	AM detection
D59	Switching	Wide/narrow switching
D63~66	Reverse current prevention	Paddle key control line
D68	Reverse current prevention	VHF/UHF TX power supply
D69	Reverse current prevention	UHF main RX power supply
D71	Reverse current prevention	UHF main RX power supply

Ref. No.	Use / Function	Operation / Condition
D73	Reverse current prevention	Produce VURXB by VRXB and URXB
D74	Reverse current prevention	Produce R14 by R20S and R14S
D74	Reverse current prevention	UHF RX power supply
D76	Reverse current prevention	UHF sub RX power supply
D77	Limiter	VHF large input prevention
D78	Limiter	UHF large input prevention
D79,80	Variable capacitor	VHF sub RX BPF tuning
D81	Switching	UHF RX signal line
D82	Switching	RX power supply
D83	Rectifier	Squelch control voltage noise rectification
D84~86	Variable capacitor	VHF main RX BPF tuning
D87	Variable capacitor	VHF sub RX BPF tuning
D88	Variable capacitor	VHF main RX BPF tuning
D89	Constant voltage	AF amplifier power supply
D90,91	Switching	UHF sub RX signal line
D92~94	Switching	UHF RX signal line
D95	Switching	Sub RX signal line
D96	Switching	VHF sub RX signal line
D97	Switching	RX power supply
D100	Variable capacitor	VHF sub RX BPF tuning
D98,99	Reverse current prevention	D95 control line
D101	Switching	VHF sub RX signal line
D400	Reverse current prevention	Unlock signal detection (HF LO2 VCO)
D401	Variable capacitor	Sub VCO1
D402	Variable capacitor	Sub VCO2
D403	Variable capacitor	HF LO2 VCO
D404	Switching	Sub VCO1 oscillation frequency changeover
D405	Switching	Sub VCO2 oscillation frequency changeover
D406	Variable capacitor	HF LO2 VCO
D407	Reverse current prevention	Unlock signal detection (Sub VCO)
D408	Variable capacitor	HF REF VCO
D409,410	Variable capacitor	UHF VCO
D411,412	Variable capacitor	VHF VCO
D413	Variable capacitor	VHF REF VCO
D416	Variable capacitor	HFLO1, VCO1
D417	Variable capacitor	HFLO1, VCO3
D418	Switching	HFLO1, VCO1 output
D419	Switching	HFLO1, VCO2 output
D420	Variable capacitor	HFLO1, VCO2
D421	Switching	HFLO1, VCO2 output
D422	Reverse current prevention	Unlock signal detection (VHF VCO)

DESCRIPTION OF COMPONENTS

Ref. No.	Use / Function	Operation / Condition
D423	Reverse current prevention	Unlock signal detection (UHF VCO)
D426	Switching	On in main VHF RX mode
D427	Switching	On in VHF TX mode
D428	Switching	On in main UHF RX mode
D429	Switching	On in UHF TX mode
D430	Switching	On in main VHF RX mode
D431	Switching	On VHF TX mode
D432	Switching	On in main UHF RX mode
D433	Switching	On in UHF TX mode
D434,441	Switching	On in main VHF RX mode
D435,442	Switching	On in main UHF RX mode
D436,443	Switching	On in VHF TX mode
D437,444	Switching	On in UHF TX mode
D438	Reverse current prevention	Unlock signal detection (HF VCO)
D439,440	Switching	Filter changeover, on when 0.03~16.99MHz
D445~447	Reverse current prevention	HF LO2 is selected when HF band mode

TX-RX 3 UNIT (X57-6070-00)

Ref. No.	Use / Function	Operation / Condition
Q1,2	TX mixer	Input : 10.595MHz, 124.8MHz Output : 135.395MHz
Q3	TX IF amplifier	Amplifies 135.395MHz TX IF signal
Q4	Power switch	Supplies 5V to IC1 during TX
Q5	TX RF amplifier	Amplifies 1240~1300MHz TX RF signal
Q7,8	RX mixer	Input : 135.495MHz, 124.8MHz Output : 10.695MHz
Q9	RX AGC amplifier	
Q10	RX mixer	Input : 1104~1165MHz, 1240~1300MHz Output : 135.495MHz
Q11,12	RX RF amplifier	Amplifies 1240~1300MHz RX RF signal
Q13	Reference signal amplifier	Amplifies IC4 reference signal (31.2MHz)
Q14	Quadruple	Input : 31.2MHz Output : 124.8MHz
Q15	local oscillation signal amplifier	Amplifies local oscillation signal (124.8MHz)
Q16	Amplifier	Amplifies 8.323~8.488MHz signal
Q17	Power filter	Smooths power for VCO and loop filter
Q19	Double	Output : 1104~1165MHz

Ref. No.	Use / Function	Operation / Condition
Q20	High-frequency amplifier	Amplifies 1104~1165MHz local oscillation signal
Q301	VCO	FET for oscillation
Q302	High-frequency amplifier	VCO oscillation buffer amplifier
Q303	RX IF amplifier	Amplifies the 10.695MHz IF signal
Q304	TX IF amplifier	Amplifies the 10.595MHz IF signal
Q305~307	LPF	PLL loop LPF
Q310,311	Amplifier	Amplifies 31.2MHz signal
Q312	PLL reference signal amplifier	Amplifies PLL reference signal
Q313,314	Mixer for PLL reference signal	Input : 31.2MHz, 8.323~8.488MHz Output : 39.523~39.688MHz
Q315	Switch	RX signal mute
IC1	TX RF amplifier	
IC2	Drive power module	Amplifies to approximately 1W
IC3	Final power module	Amplifies to approximately 10W
IC4	DDS	Produces an approximately 8.4MHz signal from the 31.2MHz reference signal
IC5	PLL	VCO input : 552.253~582.303MHz Reference input : 39.523~39.688MHz
D1	TX mixer	Converts 135.395MHz signal to 1240~1300MHz
D2	Q5 base voltage stabilization	A voltage more than that stipulated for Q5 base is not to be applied
D3	Forward wave detection	
D4	Reflected wave detection	
D5~7	TX/RX changeover	On when TX
D8	Local signal changeover	Supplies a 124.8MHz signal to Q1 and Q2 during TX and to Q7 and Q8 during RX
D9	AGC starting control	Speeds the AGC start
D10	Local signal changeover	Goes ON during TX and supplies a 1104~1165MHz signal to D1
D11	Local signal changeover	Goes ON during RX and supplies a 1104~1165 MHz signal to Q10
D12	Power supply	Supply the power to the local oscillator unit from 12RXB and 12TXB
D301	VCO	Variable capacitance diode for VCO oscillation
D302	Zener diode	A voltage more than that stipulated for Q12 is not to be applied
D303	TX/RX changeover	On when TX
D304	Switch	PLL unlock detection
D305	VCO	Variable capacitance diode for VCO oscillation

SEMICONDUCTOR DATA

Main CPU : 64F2633xxxx (Control unit IC8)

■ Pin function

No.	Name	I/O	Function
1	MD1	I	Operation mode setting pin 1. Connect to Vcc.
2	MD2	I	Operation mode setting pin 2. Connect to Vcc.
3,4	NC	–	
5~8	HA0~HA3	O	Address bus.
9	Vss	–	GND.
10	HA4	O	Address bus.
11	Vcc	I	3.3V.
12~14	HA5~HA7	O	Address bus.
15	Vss	–	GND.
16	ADC1	O	Analog switch control signal.
17	PVcc	I	5V.
18	ADC2	O	Analog switch control signal.
19	PSC	O	Power relay control.
20	DASH	I	Electronic key dash signal.
21	DOT	I	Electronic key dot signal.
22	STSC	O	RS-232 IC start instruction.
23	CKY	O	Transmission power output specification.
24	CTS2	I	UART operation instruction input from personal computer control.
25	RTS2	O	UART operation instruction output to personal computer control.
26	TXD2	O	Data output to PC/IF.
27	RXD2	I	Data input from PC/IF.
28	RES	O	Peripheral equipment reset input.
29	Vss	–	GND.
30	BEEP	O	Beep pattern output to DSP.
31	PCK	O	PLL unit common clock output.
32	PDA	O	PLL unit common data output.
33	DATA	O	Common data output.
34	PSW	I	Power switch interrupt.
35,36	NC	–	
37	CLOCK	O	Common clock output.
38	MRBK	O	Main RBK output.
39	SRBK	O	Sub RBK output.
40	MABK	O	Main ABK output.
41	SABK	O	Sub ABK output.

No.	Name	I/O	Function
42	DRES	O	DSP reset output.
43	ULK	I	Main/sub common unlock signal.
44	12ULK	I	1.2GHz band unlock signal.
45	DREN	O	DRU-3 enable.
46	ESCK	O	EEPROM clock output.
47	ESI	O	EEPROM data output.
48	Vss	–	GND.
49	HD0	O	Data bus.
50	PVcc	I	5V.
51~57	HD1~HD7	O	Data bus.
58	TXD0	O	Data output to main unit panel.
59	RXD0	I	Data input from main unit panel.
60	PVcc	I	5V. Power supply pin for pin 52~61.
61	START	I	Interrupt for returning from sleep mode. (PC/mobile head)
62	Vss	–	GND.
63	TXD1	O	Data output to mobile head.
64	RXD1	I	Data input from mobile head.
65	BOVR	I	Over voltage detection interrupt.
66	TTO	O	AT-300 control signal.
67,68	NC	–	
69	TSO	O	AT-300 control signal.
70	TTI	I	AT-300 control signal.
71	AMD	I	Amplitude comparison detection inst-ruction input.
72	CSD2	O	DSP control chip select 2
73	CSD1	O	DSP control chip select 1.
74	TSI	I	AT-300 control signal.
75	NC	O	
76	PLLVcc	I	Internal PLL oscillator power 3.3V.
77	PLLCAP	I	
78	PLLVss	–	Internal PLL oscillator GND.
79	RESET	I	Hard reset input.
80	NMI	I	Normally H.
81	STBY	I	Hardware standby pin. Normally : H
82	FWE	I	Flash light enable. Normally : L, During writing : H
83	XTAL	I	Crystal oscillator 11.0592MHz.

SEMICONDUCTOR DATA

No.	Name	I/O	Function
84	Vcc	I	3.3V.
85	EXTAL	I	Crystal oscillator 11.0592MHz.
86	Vss	–	GND.
87,88	NC	I	
89	PVcc	I	3.3V.
90	PHD	I	Phase comparison detection instruction input.
91	Vss	–	GND.
92	NC	O	
93	HRD	O	External address space lead pin. Normally : H
94	HWR	O	External space write strobe (D15~D8).
95	BACKUP	I	Voltage reduction interrupt.
96	WAIT	I	Bus cycle wait state request.
97	FEN2	O	Final serial-parallel enable 2 (AT).
98	FEN1	O	Final serial-parallel enable 1 (LPF).
99,100	NC	–	
101	Avcc	I	5V.
102	VREF	I	5V.
103	MSM	I	Main SM voltage input.
104	SSM	I	Sub SM voltage input.
105	AXC	I	SW (VSF/MALT).
106	AYC	I	SW (VSR/SALT).
107	AZC	I	SW (MSQ/SMQ).

No.	Name	I/O	Function
108	BXC	I	SW (MPU/MDN/ALC/Reserve).
109	BYC	I	SW (THHF/THU/TH12/TEST).
110	PCHECK	I	Panel CPU connection check input signal.
111	DTDT	I	DTMF decoder data input.
112	NAR	I	VS-3 serial data input permission judgment.
113	EOM	I	DRU-3 message end judgment.
114	KYS	I	Key jack connection judgment.
115	CTS0	I	UART operation instruction input from main unit panel.
116	KEY	I	Key down instruction.
117	PKSA	I	Packet transmission instruction input.
118	SS	I	PTT transmission instruction input.
119	AVss	–	GND.
120	LICS	O	Input latch control chip select.
121	LOCS	O	Output latch control chip select.
122	DTSTD	I	DTMF decoder analysis end signal.
123	EDA	I	EEPROM data input.
124	EEN	O	EEPROM enable.
125	RST0	O	UART operation instruction output to main unit panel.
126	RXD3	I	Data input from TNC.
127	TXD3	O	Data output to TNC.
128	MD0	I	Operation mode setting pin 0. Connect to Vss.

SEMICONDUCTOR DATA

Panel CPU : 30624FGAGxxxxx (TX-RX 1 unit IC801)

■ Pin function

No.	Name	I/O	Function
1,2	KEY	O	Key illumination LED control signal.
3	–	–	Pull up to Vcc.
4	LSUB	O	Sub LED control signal.
5	MULTI	O	Multi LED control signal.
6	–	–	Vss connection.
7	–	–	Pull down to Vss.
8,9	–	–	Pull up to Vcc.
10	RES	I	Reset.
11	XOUT	O	System clock.
12	Vss	–	Vss.
13	XIN	I	System clock.
14	Vcc	–	Vcc.
15	–	–	Pull up to Vcc.
16	MUL1	I	Multi/CH encoder interrupt port.
17	LOW1	I	Low encoder interrupt port.
18	HI1	I	High encoder interrupt port.
19	MAA	I	Main encoder A.
20	MAB	I	Main encoder B.
21	RITA	I	RIT encoder A.
22	RITB	I	RIT encoder B.
23	MUL2	I	Multi/CH encoder data input.
24	LOW2	I	Low encoder data input.
25	HI2	I	High encoder data input.
26~28	–	–	Pull up to Vcc.
29	CON	O	CON LED control signal.
30	STA	O	STA LED control signal.
31	9.6K	O	9.6K KED control signal.
32	–	–	Pull down to Vss.
33	TXD0	O	UART data transmission port to main CPU.
34	RXD0	I	UART data reception port from main CPU.
35	RTS0	O	RTS output to main CPU.
36	CTS0	I	RTS input from main CPU.
37~40	–	–	Pull down to Vss.
41~44	–	–	Pull up to Vcc.
45	DIM	O	LED dimmer control signal.
46	SRX	O	Sub RX LED control signal.

No.	Name	I/O	Function
47	STX	O	Sub TX LED control signal.
48	MRX	O	Main RX LED control signal.
49	MTX	O	Main TX LED control signal.
50	FUNC	O	FUNC LED control signal.
51	LINH	O	LCD segment display off control output.
52	LMO	O	LCD driver control output.
53	LCK	O	Common clock output.
54	LDA	O	Common data output.
55	LCS1	O	LDC (segment) driver 1 chip select output.
56	LCS2	O	LCD (segment) driver 2 chip select output.
57	LCS3	O	LCD (dot) driver chip select output.
58	LCS4	O	Serial-parallel IC chip select output.
59	LCS5	O	Reserve.
60	Vcc	–	Vcc.
61	LRES	–	LCD driver reset control signal.
62	Vss	–	Vss.
63~65	–	–	Pull up to Vcc.
66~70	S0~S4	O	Key scan output bit 0~4
71	PBKC	I	Backup processing start signal.
72	KC	I	Key input C.
73	KB	I	Key input B.
74	KA	I	Key input A.
75,76	–	–	Pull up to Vcc.
77~86	K9~K0	I	Key input 9~0.
87	SUBS	I	Sub on/off changover.
88	MAF	I	Main AF.
89	MSQL	I	Main SQL.
90	CWBC	I	CW BC.
91	MRF	I	Main RF.
92	SAF	I	Sub AF.
93	SSQL	I	Sub SQL.
94	AVss	–	Vss connection.
95	–	–	Pull up to Vcc.
96	VREF	–	ADC reference voltage. Vcc connection.
97	AVcc	–	ADC circuit power. Vcc connection.
98~100	–	–	Pull up to Vcc.

SEMICONDUCTOR DATA

DSP : 320VC5402PGE (Control unit IC515,516)

■ Pin description

Pin name	Type*	Description
		Data signal
A19~A0	O/Z	Parallel address bus A19 (MSB) to A0 (LSB). The low-order 16 bits (A0 to A15) of the address pin are multiplexed to address to external memory (data, program) or I/O. The high-order 4 bits (A16 to A19) are used to address to external program space. These pins are high impedance when in hold mode or when $\overline{OFF}$ is low.
D15~D0	I/O/Z	Parallel data bus D15 (MSB) to D0 (LSB). D15 to D0 are multiplexed to transfer data between the core CPU and external data/program memory or I/O device. The data bus becomes high impedance when data is not output or RS or $\overline{HOLD}$ is low. It also becomes high impedance when $\overline{OFF}$ is low. The data bus has a bus holder to reduce power consumption of unused pins. When there is a bus holder, external bias resistors for unused pins are not necessary. When '5402 does not drive the data bus, the bus holder retains the preceding logic level pin. The '5402 data bus holder is disabled on reset, and enabled/disabled through the BH bit of the bank switching control register (BSCR).
		Initialization, interrupt and reset operation
$\overline{IACK}$	O/Z	Interrupt signal. Interrupt reception and interrupt vector specified by A15 to A0 are fetched by the program counter. It becomes high impedance when $\overline{OFF}$ is low.
$\overline{INT0}$~ $\overline{INT3}$	I	External user interrupt input. $\overline{INT0}$ to $\overline{INT3}$ have priorities and can be masked by interrupt mask resister (IMR) and interrupt mode bit. Polling and reset can be performed by the interrupt flag register (IFR).
$\overline{NMI}$	I	Interrupt signal that cannot be masked. This external interrupt cannot be masked by INTM or IMR. When $\overline{NMI}$ is low, the vector is trapped.
$\overline{RS}$	I	Reset. $\overline{RS}$ stops DSP operation and initializes the CPU and peripheral. When $\overline{RS}$ goes high, execution starts from 0FF80h address of the program memory. $\overline{RS}$ affects various registers and status bits.
MP/$\overline{MC}$	I	Microprocessor/microcomputer mode selection. If it is low on reset, the microcomputer mode is selected, and the internal program ROM is mapped to the high-order 4K words of the program memory space. If it is high on reset, the microprocessor mode is selected and the onchip ROM is erased from the program space. This pin is sampled only on reset, and when the MP/$\overline{MC}$ bit of the processor mode status (PMST) register is reset, the selected mode is made invalid.
		Multi-processing signal
$\overline{BIO}$	I	Branch control. When $\overline{BIO}$ is active, a conditional branch can be executed. When it is low, the processor executes a conditional branch. The XC instruction samples $\overline{BIO}$ condition in the pipeline decode phase. Other instructions sample $\overline{BIO}$ in the read phase.
XF	O/Z	External flag output (latch signal that can be changed by software). It is set to high by SSBX XF instruction, and set to low by loading an RSBX XF instruction or ST1. This signal is used as a communication or general output signal when several DSPs are used. It becomes high impedance when $\overline{OFF}$ signal is at low level, and is set to high level on reset.
		Memory control signal
$\overline{DS}$ $\overline{PS}$ $\overline{IS}$	O/Z	Data, program, or I/O space select signal. It is always at high level, except when it is driven at low level to access a specific external memory space. It is active while the address is effective. In hold mode, it becomes high impedance when the $\overline{OFF}$ signal is at low level.
$\overline{MSTRB}$	O/Z	Memory strobe signal. It is always at high level, except when accessing data or program memory through an external bus. In hold mode, it becomes high impedance when the $\overline{OFF}$ signal is at low level.
READY	I	Data ready signal. It indicates that an external device has finished preparing accessing a bus. If it is not ready (READY is at low level), it waits one cycle and checks the READY signal again. At least two software wait states must be programmed for the processor to detect a READY signal. The READY signal is not sampled until software wait states are complete.
R/$\overline{W}$	O/Z	Read/write signal. It indicates the direction of data transfer with an external device. It is normally at high level (read mode) except when it goes low to execute a write operation. In hold mode, it becomes high impedance when the $\overline{OFF}$ signal is at low level.

SEMICONDUCTOR DATA

Pin name	Type*	Description
$\overline{\text{IOSTRB}}$	O/Z	I/O strobe signal. It is always at high level (read mode) except when accessing an I/O device through an external bus. In hold mode, it becomes high impedance when the $\overline{\text{OFF}}$ signal is at low level.
$\overline{\text{HOLD}}$	I	Hold input signal. Address, data, or control signal control input signal. When this signal is accepted, the address, data, or control signal becomes high impedance.
$\overline{\text{HOLDA}}$	O/Z	Hold response signal. It notifies the external circuits that the processor is in hold state and the address, data and control signals are high impedance so that they can be used by the external circuits. It becomes high impedance when the $\overline{\text{OFF}}$ signal is at low level.
$\overline{\text{MSC}}$	O/Z	Microstate completion signal. $\overline{\text{MSC}}$ indicates that all software wait states are complete. When several software wait states are enabled, $\overline{\text{MSC}}$ becomes active at the beginning of the first software wait state and becomes inactive high at the beginning of the last software wait state. When READY input is connected, $\overline{\text{MSC}}$ inserts an external wait state forcibly after completion of the last internal wait state. It becomes high impedance when the $\overline{\text{OFF}}$ signal is at low level.
$\overline{\text{IAQ}}$	O/Z	Instruction capture signal. It becomes active low when an instruction address is on the address bus. It becomes high impedance when the $\overline{\text{OFF}}$ signal is at low level.
Oscillator/timer signal		
CLKOUT	O/Z	Master/clock output signal. A signal with the same frequency as the CPU machine cycle is output. The internal machine cycle is delimited at a rising edge of this signal. It becomes high impedance when the $\overline{\text{OFF}}$ signal is at low level.
CLKMD1 ~ CLKMD3	I	Clock mode select signal. These input signals are used to select a mode that is initialized after the clock generator is reset. The CLKMD1 to CLKMD3 logic level is latched when the reset pin is low and the clock mode register is initialized in the selected mode. The clock mode is changed by software after reset, but the clock mode select signal is not affected until the device is reset again.
X2/CLKIN	I	Oscillator input. This is an input to the onchip oscillator. If an internal oscillator is not used, X2/CLKIN functions as a clock input and is driven by the external clock source.
X1	O	Output pin from crystal internal oscillator. If the internal oscillator is not used, do not connect this pin. It does not become high impedance when the $\overline{\text{OFF}}$ signal is at low level.
TOUT0	O/Z	Timer 0 output. When onchip timer 0 count exceeds 0, a pulse is output. It has the same pulse width as CLKOUT. It becomes high impedance when the $\overline{\text{OFF}}$ signal is at low level.
TOUT1	O/Z	Timer 1 output. When onchip timer 1 count exceeds 0, a pulse is output. It has the same pulse width as CLKOUT. TOUT1 is output from the HPI $\overline{\text{HINT}}$ pin. It is disabled when HPI is disabled. It does not become high impedance when the $\overline{\text{OFF}}$ signal is at low level.
Multi-channel buffered serial port signal		
BCLKR0 BCLKR1	I/O/Z	Receive clock input. BCLKR can be used as input and output, and becomes input after reset. It is a serial shift clock of the receive side buffered serial port.
BDR0 BDR1	I	Serial data reception input.
BFSR0 BFSR1	I/O/Z	Reception input frame synchronous pulse. BFSR can be used as input and output, and becomes input after reset. The BFSR pulse ends BDR and initializes data reception.
BCLKX0 BCLKX1	I/O/Z	Transmission clock. BCLKX is a McBSP transmission serial shift clock. BCLKX can be used as input and output, and becomes input after reset. It becomes high impedance when the $\overline{\text{OFF}}$ signal is at low level.
BDX0 BDX1	O/Z	Serial data transmission output. BDX becomes high impedance when transmission is not performed, $\overline{\text{RS}}$ is low, or $\overline{\text{OFF}}$ is low.
BFSX0 BFSX1	I/O/Z	Transmission I/O frame synchronizing pulse. The BFSX pulse initializes data transmission. It can be used as input and output, and becomes input after reset. It becomes high impedance when the $\overline{\text{OFF}}$ signal is low.
Other signals		
NC		No connection.

SEMICONDUCTOR DATA

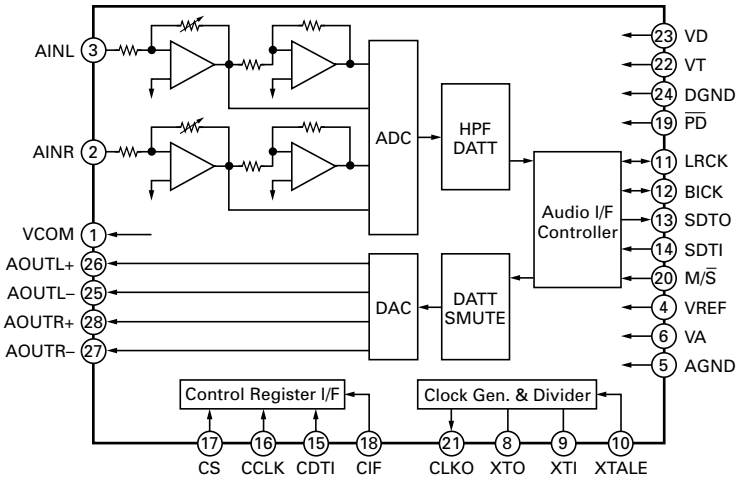
Pin name	Type*	Description
		Host port interface (HPI) signal
HD0~ HD7	I/O/Z	Parallel bi-directional data bus. The HPI data bus is used by the host device bus to exchange data with the HPI register. It becomes high impedance when data is not output or $\overline{OFF}$ is low. The HPI data bus has a bus holder to reduce power consumption of unused pins. When the DSP does not drive the HPI data bus, the bus holder retains the preceding logic level. The HPI data bus holder is disabled on reset, and can be enabled/disabled through the HBH bit of the BSCR.
HCNTL0 HCNTL1	I	Control signal. HCNTL0 and HCNTL1 select one of three HPI registers for accessing the host. Control input includes an internal pull-up register that is enabled only when HPIENA = 0.
HBIL	I	Byte recognition signal. HBIL recognizes the first or second byte to be transmitted. HBIL input includes an internal pull-up register that is enabled only when HPIENA = 0.
$\overline{HCS}$	I	Chip select signal. $\overline{HCS}$ selects HPI input and is driven to low during access. The chip select signal includes an internal pull-up register that is enabled only when HPIENA = 0.
$\overline{HDS1}$ $\overline{HDS2}$	I	Data strobe signal. $\overline{HDS1}$ and $\overline{HDS2}$ are driven by host read and write strobe for the control signal. There is an internal pull-up register that is enabled only when HPIENA = 0.
$\overline{HAS}$	I	Address strobe signal. $\overline{HAS}$ is necessary for the host with multiplexed address and data pins to latch an address with the HPIA register. There is an internal pull-up register that is enabled only when HPIENA = 0.
HR/$\overline{W}$	I	Read/write. HR/$\overline{W}$ controls HPI transfer direction. There is an internal pull-up register that is enabled only when HPIENA = 0.
HRDY	O/Z	Ready signal. Ready output notifies the host that the HPI is ready to transmit. It becomes high impedance when the $\overline{OFF}$ signal is low.
$\overline{HINT}$	O/Z	Host interrupt signal. This output is used to interrupt the host. When the DSP is reset, it goes high. $\overline{HINT}$ can be used as timer 1 output (TOUT1) when HPI is disabled. It becomes high impedance when the $\overline{OFF}$ signal is low.
HPIENA	I	HPI module select signal. To enable HPI, this pin must be made high on reset. The internal pulldown register is always active and the HPIENA pin is sampled at a rising edge of $\overline{RS}$. When HPIENA is open or low on reset, the HPI module is disabled. The HPIENA pin is not affected until the DSP is reset.
		Power supply pins
CVDD	S	+VDD. CPU core 1.8V power supply.
DVDD	S	+VDD. I/O pin 3.3V power supply.
Vss	S	Ground.
		Test pins
TCK	I	IEEE standard 1149.1 test clock. Normally, clock input with a duty ratio of 50%. When the input signal (TMS, TDI) changes on the TAP (test access port), it is loaded into the TAP controller, instruction register, and test data register at a rising edge of TCK. The TAP output signal (TDO) data changes at a falling edge of TCK.
TDI	I	IEEE standard 1149.1 test data input pin with an internal pull-up device. TDI data is loaded into a register (instruction or data) at a rising edge of TCK.
TDO	O/Z	IEEE standard 1149.1 test data output pin. The contents of a register (instruction or data) are output from TDO at a falling edge of TCK. TDO is high impedance except during data scan processing. It also becomes high impedance when the $\overline{OFF}$ signal is low.
TMS	I	IEEE standard 1149.1 test mode select pin with an internal pull-up device. The serial control input is loaded into the TAP controller at a rising edge of TCK.
$\overline{TRST}$	I	IEEE standard 1149.1 test reset pin with internal pulldown device. When it is high, the device enters the IEEE standard 1149.1 scan system control mode. If it is low or not connected, the IEEE standard 1149.1 signal is ignored.
EMU0	I/O/Z	Emulator pin 0. When the $\overline{TRST}$ pin is low, this pin must be high . When the $\overline{TRST}$ pin is high, this pin is used as an interrupt for the emulator system and becomes an I/O for the IEEE standard 1149.1 scan.
EMU1/ $\overline{OFF}$	I/O/Z	Emulator 1 pin/output control pin. When the $\overline{TRST}$ pin is high, this pin is used as an interrupt for the emulator system and becomes an I/O for the IEEE standard 1149.1 scan system. When the $\overline{TRST}$ pin is low, all outputs are high impedance. Note that the $\overline{OFF}$ pin is exclusive for test and emulation. (They cannot be executed at the same time.) $\overline{OFF}$ conditions are as follows; $\overline{TRST}$ = L, EMU0 = H, EMU1/$\overline{OFF}$ = L.

* I = Input, O = Output, Z = High impedance, S = Supply

SEMICONDUCTOR DATA

CODEC (24 bit) : AK4524 (Control unit IC518)

■ Block diagram



■ Pin function

No.	Name	I/O	Function
1	VCOM	O	Common voltage output pin, VA/2. Bias voltage os ADC inputs and DAC outputs.
2	AINR	I	Rch analog input pin.
3	AINL	I	Lch analog input pin.
4	VREF	I	Voltage reference input pin, VA. Used as a voltage reference by ADC & DAC, VREF is connected externally to filtered VA.
5	AGND	–	Analog ground pin.
6	VA	–	Analog power supply pin, 4.75~5.25V
7	TEST	I	Test pin. (Internal pull-down pin)
8	XTO	O	X'tal output pin.
9	XTI	I	X'tal/master clock input pin.
10	XTALE	I	X'tal osc enable pin. "H" : Enable, "L" : Disable
11	LRCK	I/O	Input/output channel clock pin.
12	BICK	I/O	Audio serial data clock pin.
13	SDTO	O	Audio serial data output pin.
14	SDTI	I	Audio serial data input pin.
15	CDTI	I	Control data input pin.
16	CCLK	I	Control data clock pin.
17	CS	I	Chip select pin.
18	CIF	I	Control data I/F format pin. "H" : CS falling trigger, "L" : CS rising trigger
19	$\overline{PD}$	I	Power down mode in. "H" : Power up, "L" : Power down reset and initialize the control register.
20	M/$\overline{S}$	I	Master/slave mode pin. "H" : Master mode, "L" : Slave mode
21	CLKO	O	Master clock output pin.
22	VT	–	Output buffer power supply pin, 2.7~5.25V.
23	VD	–	Digital power supply pin, 4.75~5.25V.
24	DGND	–	Digital ground pin.
25	AOUTL–	O	Lch negative analog output pin.
26	AOUTL+	O	Lch positive analog output pin.
27	AOUTR–	O	Rch negative analog output pin.
28	AOUTR+	O	Rch positive analog output pin.

Note : All input pins except pull-down pins should not be left floating.

Mixer : TA4101F (TX-RX 1 unit IC6)

No.	Name	I/O	Function
1	VRDA	I	Voltage reference input pin for DAC, VA.
2	VRAD	I	Voltage reference input pin for ADC, VA.
3	AINR	I	Rch analog input pin.
4	VCMR	O	Rch common voltage output pin, 0.45 x VA. Connect a 4.7μF electrolytic capacitor and 0.1μF ceramic capacitor between this pin and AGND.
5	VCML	O	Lch common voltage output pin, 0.45 x VA. Connect a 4.7μF electrolytic capacitor and 0.1μF ceramic capacitor between this pin and AGND.
6	AINL	I	Lch analog input pin.
7	$\overline{\text{PWAD}}$	I	ADC power down mode pin. "L" : Power down
8	$\overline{\text{PWDA}}$	I	DAC power down mode pin. "L" : Power down
9	MCLK	I	Master clock input pin.
10	LRCK	I	Input/output channel clock pin.
11	SCLK	I	Audio serial data clock pin.
12	SDTO	O	Audio serial data output pin.
13	DGND	–	Digital ground pin.
14	VD	–	Digital power supply pin.
15	SDTI	I	Audio serial data input pin.
16	CMODE	I	Master clock select pin. "H" : 384fs or 512fs, "L" : 256fs
17	DEM1	I	De-emphasis frequency select pin.
18	DEM0	I	De-emphasis frequency select pin.
19	AOUTL	O	Lch analog output pin.
20	AOUTR	O	Rch analog output pin.
21	VCOM	O	Common voltage output pin, 0.45 x VA. Connect a 4.7μF electrolytic capacitor and 0.1μF ceramic capacitor between this pin and AGND.
22	AGND	–	Analog ground pin.
23	VB	–	Substrate pin.
24	VA	–	Analog power supply pin.

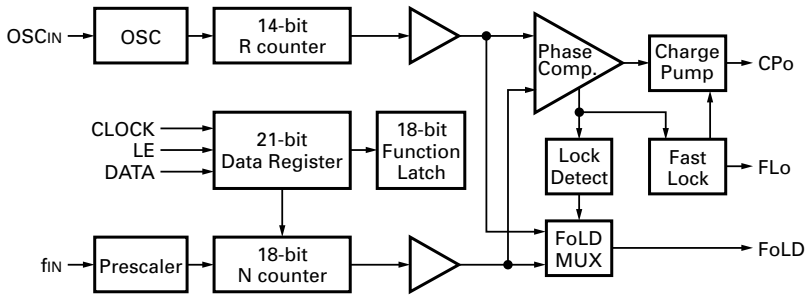
PLL : LMX2316TMX (TX-RX 2 unit IC402, TX-RX 3 unit IC5)

■ Block diagram



■ Pin description

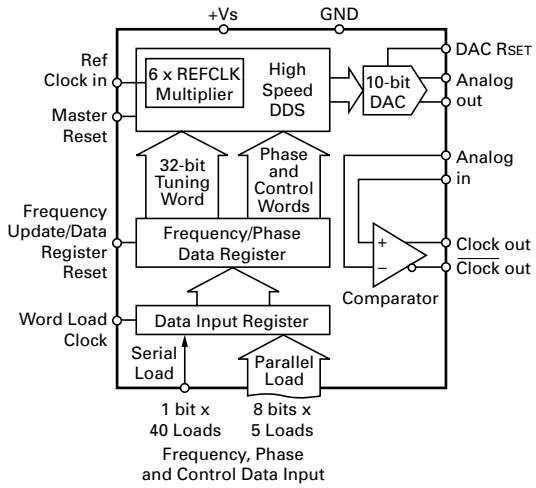
No.	Name	I/O	Description
1	FLo	O	FastLock output. For connection of parallel resistor to the loop filter.
2	CPo	O	Charge pump output. For connection to a loop filter for driving the input of an external VCO.
3	GND	–	Charge pump ground.
4	GND	–	Analog ground.
5	$\overline{f_{IN}}$	I	RF prescaler complementary input. A bypass capacitor should be placed as close as possible to this pin and be connected directly to the ground plane. The complementary input can be left unbypassed, with some degradation in RF sensitivity.
6	fIN	I	RF prescaler input. Small signal input from the VCO.
7	Vcc1	–	Analog power supply voltage input. Input may range from 2.3V to 5.5V. Bypass capacitors should be placed as close as possible to this pin and be connected directly to the ground plane. Vcc1 must equal Vcc2.
8	OSCIN	I	Oscillator input. This input is a CMOS input with a threshold of approximately Vcc/2 and an equivalent 100k input resistance. The oscillator input is driven from a reference oscillator.
9	GND	–	Digital ground.

No.	Name	I/O	Description
10	CE	I	Chip enable. A LOW on CE powers down the device and will TRI-STATE the charge pump output. Taking CE HIGH will power up the device depending on the status of the power down bit F2.
11	Clock	I	High impedance CMOS clock input. Data for the various counters is clocked in on the rising edge into the 21-bit shift register.
12	Data	I	Binary serial data input. Data entered MSB first. The last two bits are the control bits. High impedance CMOS input.
13	LE	I	Load enable CMOS input. When LE goes high, data stored in the shift registers is loaded into one of the 3 appropriate latches (control bit dependent).
14	Fo/LD	O	Multiplexed output of the RF programmable of reference dividers and lock detect. CMOS output.
15	Vcc2	–	Digital power supply voltage input. Input may range from 2.3V to 5.5V. Bypass capacitors should be placed as close as possible to this pin and be connected directly to the ground plane. Vcc1 must equal Vcc2.
16	Vp	–	Power supply for charge pump. Must be ≥ Vcc.

SEMICONDUCTOR DATA

DDS : AD9851BRS (TX-RX 3 unit IC4)

■ Block diagram



■ Pin function

No.	Name	Function
1~4 25~28	D3~D0 D7~D4	8-bit data input. The data port for loading the 32-bit frequency and 8-bit phase/control words. D7 = MSB, D0 = LSB. D7, pin 25, also serves as the input pin 40-bit serial data word.
5	PGND	6 x REFCLK multiplier ground connection.
6	PVCC	6 x REFCLK multiplier positive supply voltage pin.
7	W CLK	Word load clock. Rising edge loads the parallel or serial frequency/phase/control words asynchronously into the 40-bit input register.
8	FQ UD	Frequency update. Arising edge asynchronously transfers the contents of the 40-bit input register to be acted upon by the DDS core. FQ UD should be issued when the contents of the input register are known to contain only valid, allowable data.
9	REFCLOCK	Reference clock input. CMOS/TTL level pulse train, direct or via the 6 x REFCLK multiplier. In direct mode, this is also the SYSTEM CLOCK. If the 6 x REFCLK multiplier is engaged, then the output of the multiplier is the SYSTEM CLOCK. The rising edge of the SYSTEM CLOCK initiates operations.
10,19	AGND	Analog ground. The ground return for the analog circuitry (DAC and comparator).
11,18	AVDD	Positive supply voltage for analog circuitry (DAC and comparator, pin 18) and bandgap voltage reference (pin 11).
12	RSET	The DAC's external RSET connection– nominally a 3.92kΩ resistor to ground for 10mA out. This sets the DAC full-scale output current available from IOUT and IOUTB. RSET = 39.93/IOUT.
13	VOUTN	Voltage output negative. The comparator's "complementary" CMOS logic level output.
14	VOUTP	Voltage output positive. The comparator's "true" CMOS logic level output.
15	VINN	Voltage input negative. The comparator's inverting input.
16	VINP	Voltage input positive. The comparator's noninverting input.
17	DACBP	DAC bypass connection. This is he DAC voltage reference bypass connection normally NC (no connect) for optimum SFDR performance.
20	IOUTB	The "complementary" DAC output with same characteristics as IOUT except that IOUTB = (full-scale output – IOUT). Output load should equal that of IOUT for best SFDR performance.
21	IOUT	The "true" output of the balanced DAC. Current is "sourcing" and requires current to voltage conversion, usually a resistor or transformer referenced to GND. IOUT = (full-scale output – IOUTB).
22	RESET	Master reset pin, active high, clears DDS accumulator and phase offset register to achieve 0Hz and 0° output phase. Sets programming to parallel mode and disengages the 6 x REFCLK multiplier. Reset does mot clear the 40-bit input register. On power up, asserting RESET should be the first priority before programming commences.
23	DVDD	Positive supply voltage pin for digital circuitry.
24	DGND	Digital ground. The ground return pin for the digital circuitry.

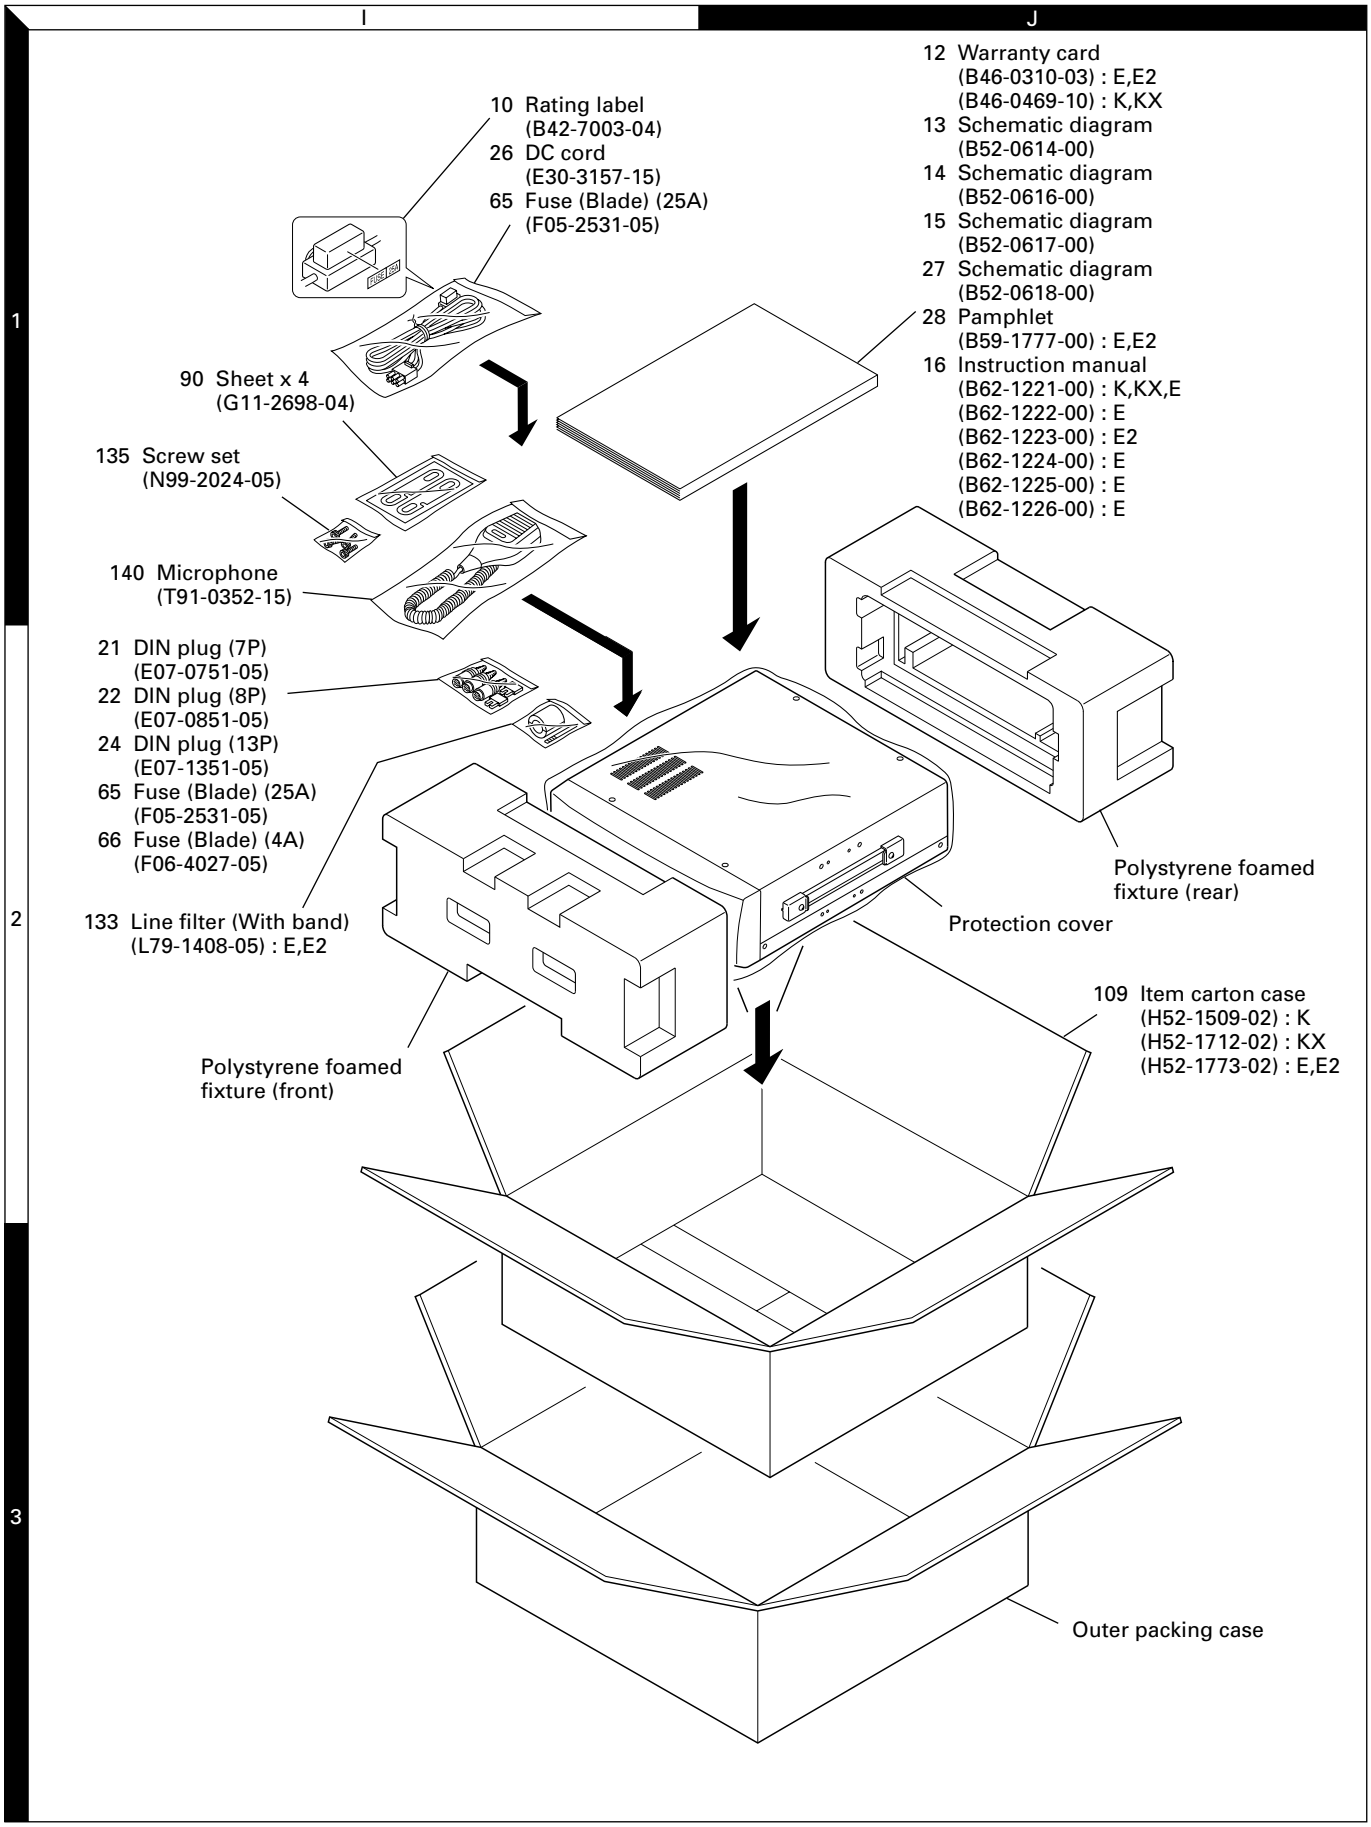
PACKING



Parts with the exploded numbers larger than 700 are not supplied.

ADJUSTMENT

Required Test Equipment

1. DC Voltmeter (DC V.M)
1) Input resistance : More than 1MΩ
2) Voltage range : 1.5 to 1000V AC/DC
Note : A high-recision multimeter may be used. However, accurate readings can not be obtained for high-impedance circuits.

2. DC Ammeter
1) Current range : 100mA, 1.5A, 15A, high-precision ammeter may be used.

3. RF VTVM (RF V.M)
1) Input impedance : 1MΩ and less than 3pF, min.
2) Voltage range : 10mV to 300V
3) Frequency range : 10kHz to 500MHz

4. AF Voltmeter (AF V.M)
1) Frequency range : 50Hz to 10kHz
2) Input resistance : 1MΩ or greater
3) Voltage range : 10mV to 30V

5. AF Generator (AG)
1) Frequency range : 200Hz to 5kHz
2) Output : 1mV or less to 1V, low distortion

6. AF Dummy Load (DM. SP)
1) Impedance : 8Ω
2) Dissipation : 3W or greater

7. Oscilloscope
Requires high sensitivity, and external synchronization capability (150MHz or greater).

8. Sweep Generator (Sweep G.)
1) Center frequency : 50kHz to 140MHz
2) Frequency deviation : Maximum ±35kHz
3) Output voltage : 100mV or greater

9. Standard Signal Generator (SSG)
1) Frequency range : 50kHz to 60MHz
2) Output : –133dBm/0.1μV to 7dBm/1V
3) Output impedance : 50Ω
4) AM and FM modulation can be possible
Note : Generator must be frequency stable.

10. Frequency Counter (f. counter)
1) Minimum input voltage : 50mV
2) Frequency range : 150MHz or greater

11. Noise Generator (Noise G.)
Must generate ignition noise containing harmonics beyond 30MHz.

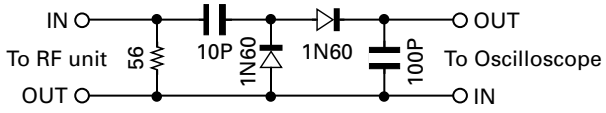
12. RF Dummy Load
1) Impedance : 150Ω and 50Ω
2) Dissipation : 150W or greater

13. Linear Detector
1) Frequency range : 60MHz or greater

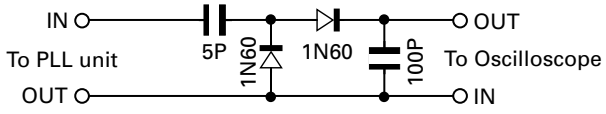
14. Power Meter
1) Impedance : 50Ω
2) Dissipation : 300W continuous or greater
3) Frequency limits : 60MHz or greater

15. Spectrum Analyzer
1) Frequency range : 100kHz to 140MHz or greater
2) Bandwidth : 1kHz to 3MHz

16. Detector
1) For adjustment of BPF



2) For adjustment of PLL/VCO BPF



17. Directional Coupler

18. Monitor Receiver
R-1000 class

19. Microphone
MC-43S or MC-60S8

20. Tracking Generator

21. Distortion Meter

22. Double Signal Pad (50Ω)

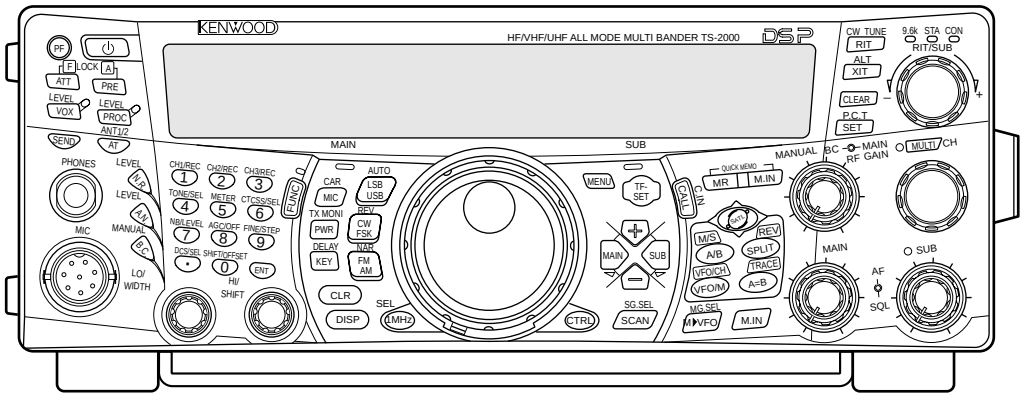
ADJUSTMENT

Preparation

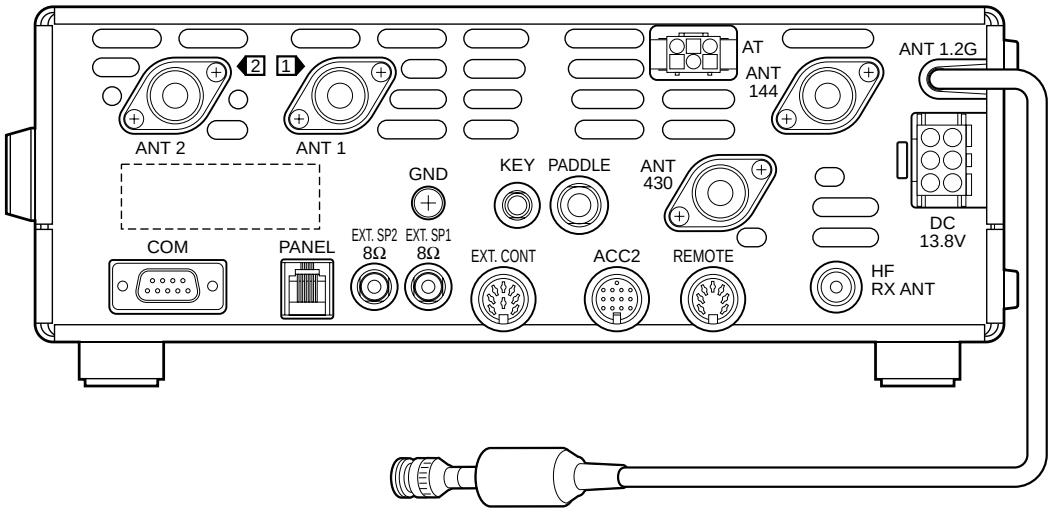
Unless otherwise specified, knobs and switches should be set as follows.

POWER ..... ON
MANUAL BC ..... Center
MAIN RF GAIN ..... MAX
MAIN AF GAIN ..... MIN
NAIN SQL ..... MIN
SUB AF GAIN ..... MIN
SUB SQL ..... MIN

■ Front panel

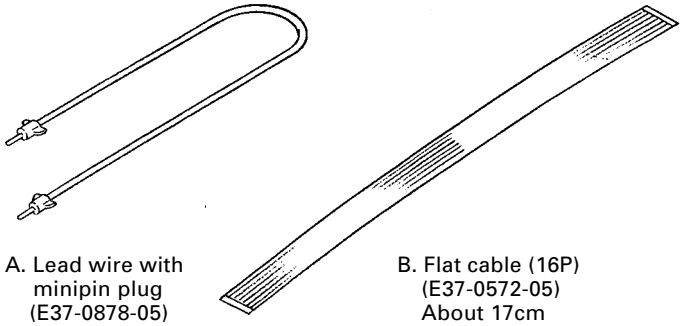


■ Rear panel



ADJUSTMENT

Service Jig

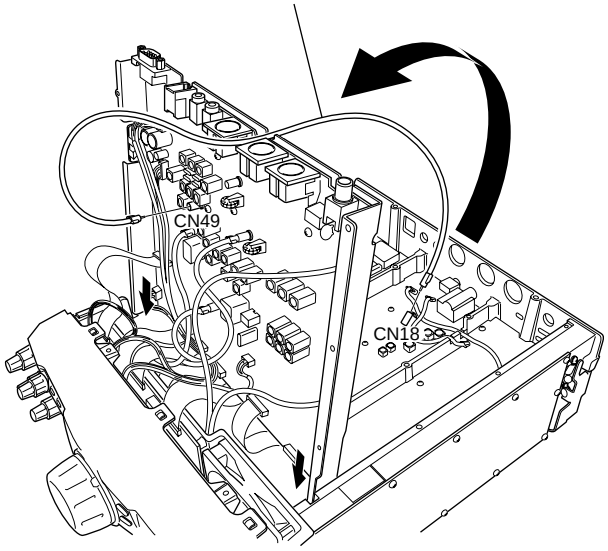


A. Lead wire with minipin plug (E37-0878-05) About 56cm

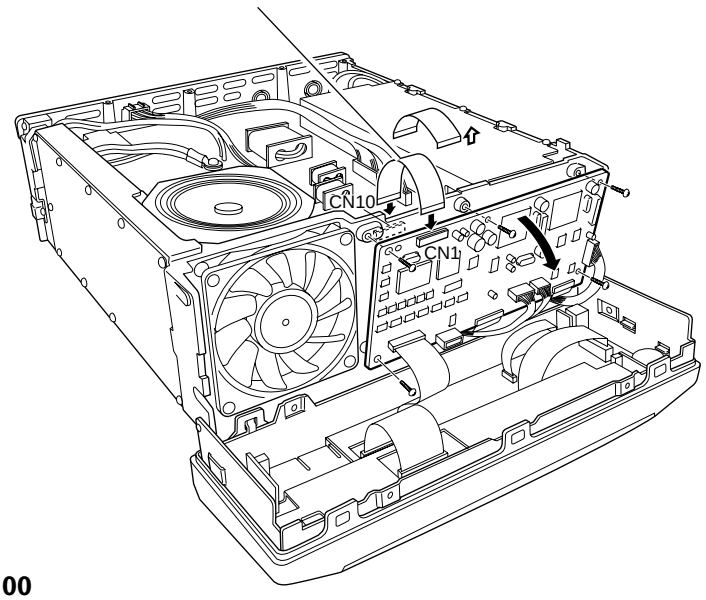
B. Flat cable (16P) (E37-0572-05) About 17cm

■ How to use

A. Lead wire with minipin plug



B. Flat cable (16P)



Adjustment Mode

■ Outline

1. The TS-2000/X can be adjusted manually (by turning a coil, trimmer, etc.) or by setting the service adjustment mode (adjustment with panel keys). In the service adjustment mode (simply referred to as the adjustment mode below), adjustments items are shown in menu No.00 to 126 and all data are saved in the EEPROM (X53-391: IC7).
2. To enter adjustment mode, the user firmware in the main unit must be rewritten with adjustment firmware. (The user firmware is factory-set.)

■ Diagram of uploading the adjustment firmware

1. Checksum confirmation
   Switch the transceiver on while pressing and hold [N.R.] and [MIC/CAR] keys.

↓

2. Preparation of uploading the data
   1) Access Menu No. 56 and select 9600 bps, then switch the transceiver OFF.
      Turn the transceiver ON again.
   2) Back up the user data in the transceiver (Menu configuration and Memory channel data)
      Run the programming software (W05-0855-00), then select "Menu/MRch READ from RADIO"
      Name the file that can be identified easily.
      (Such as a serial number)

↓

3. Uploading the adjustment firmware
   1) Turn the switch (S1) ON in TX-RX1 unit (X57-605 A).
   2) Upload the adjustment firmware, using "ADJUST FIRMWARE WRITE" menu.
   3) Turn the switch (S1) OFF in TX-RX1 unit (X57-605 A).
   4) Turn the transceiver ON while pressing [A=B] key to perform the full reset.

Refer to the uploading procedure 1~8.

↓

4. Repair and adjustment

↓

5. Uploading the user firmware
   1) Turn the switch (S1) ON in TX-RX1 unit (X57-605 A).
   2) Upload the user firmware, using "USER FIRMWARE WRITE" menu.
   3) Turn the switch (S1) OFF in TX-RX1 unit (X57-605 A).
   4) Turn the transceiver ON while pressing [A=B] key to perform the full reset.

Refer to the uploading procedure 9.

↓

6. Checksum confirmation
   Switch the transceiver on while pressing and hold [N.R.] and [MIC/CAR] keys.
   If the user firmware has not changed, the checksum is same as the value in step 1.
   If the user firmware has been updated, the checksum should match the new checksum.

Refer to the uploading procedure 10.

↓

7. Uploading the user firmware
   1) Turn the transceiver ON while pressing [A=B] key to perform the full reset.
   2) Run the programming software (W05-0855-00), then select "Menu/MRch WRITE to the RADIO"

ADJUSTMENT

■ Procedure for writing adjustment firmware (for both user and adjustment firmware)

1. Remove the lower case and set the slide switch (S1) of the TX-RX 1 unit (X57-605A) to ON (move the switch toward the front).
2. Connect the RS-232C port of the personal computer with the COM port of the main unit with a D-SUB (9-pin) straight cable (female-female).
3. Connect the external power supply (13.8V) to the main unit and turn the power supply ON. The main unit does not turn on any indicators, but it is ready to rewrite firmware. Do not operate the power switch on the main unit.
4. Write firmware using writing software. (See the help of the software for information on how to write it.)
5. After writing the firmware, turn the external power supply OFF and remove the RS-232C cable.
6. Set the slide switch (S1) of the TX-RX 1 unit (X57-605A) to OFF (move the switch toward the rear).
7. Turn the external power supply ON.
8. Turn the main unit ON and confirm that the indicator lights. Then, perform all reset (hold down [A=B] key and press the [POWER] key) and confirm that the initial state is displayed.
9. After adjustment, rewrite adjustment software back to user firmware using the writing software. (See the help of the software for information on how to write it.)
10. After rewriting user software, check the checksum (hold down the [N.R.] and [MIC/CAR] keys and press the [POWER] key. Menu No.125). Then , perform all reset.

Notes :

1. When adjustment software is loaded and the main unit is turned ON, a beep sounds to indicate the adjustment mode. This does not indicate a failure.
   When any key (except [PF] key) is pressed after a frequency is displayed, the beep stops.
2. Do not return the TS-2000/X that contains adjustment firmware to the user.

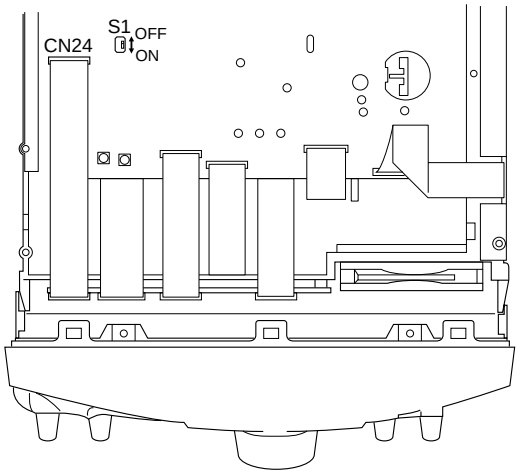
■ Adjustment mode operation procedure

1. Start the adjustment mode.
   Hold down the [N.R.] and [MIC/CAR] keys and press the [POWER] key. The adjustment mode is set and a menu number is displayed below the M.CH on the main band side (left) of the display.

2. Select adjustment mode menu No.
   Turn the [MULTI CH] knob to change the menu No.
3. Change adjustment mode setting data.
   Setting data can be changed with [+] or [–] key.
4. Write adjustment mode data.
   Press [+] or [–] key on the main unit or [UP] or [DOWN] key on the microphone on menu No. 124.
5. Cancel adjustment mode.
   Press the [CLR] key to return to the normal VFO mode.

Note:

When the power is turned OFF in the middle in the adjustment mode, it is canceled.



Adjustment Mode Menu (Menu No. 00~126)

No.	Adjustment item	Item	Frequency	Mode
00	ALC reference voltage	14.1M	14.1M	USB
01	146M BPF center voltage (Main)	146M	145.99M	USB

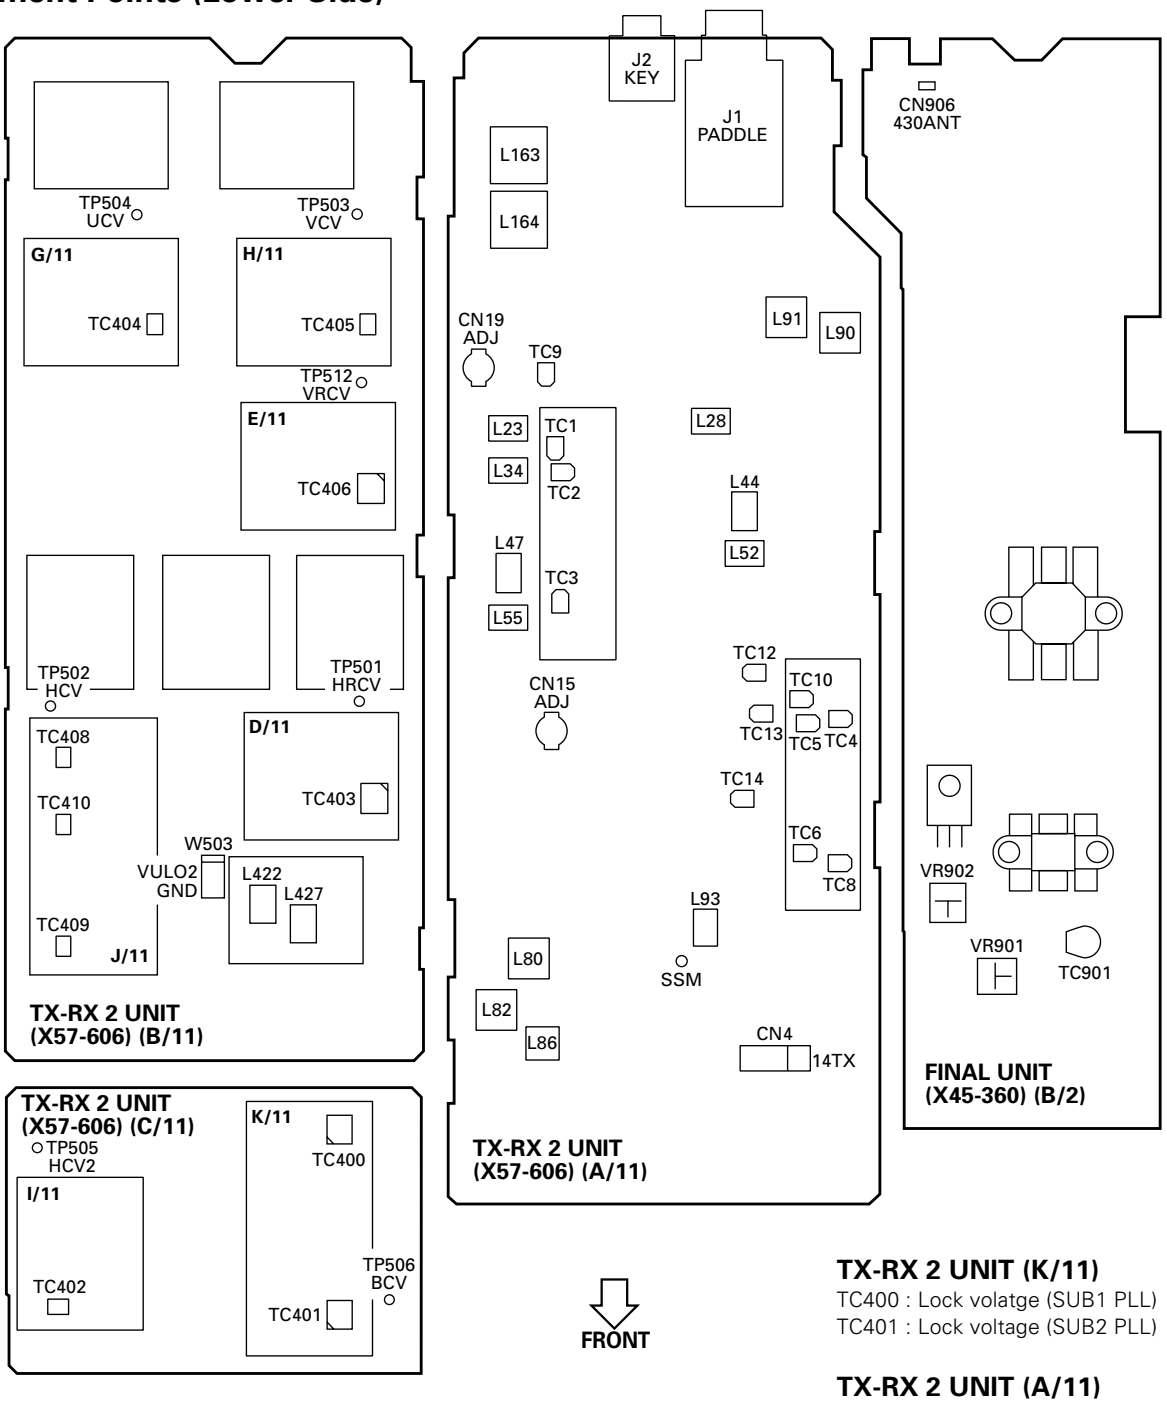
Adjustment Points (Lower Side)



TX-RX 2 UNIT (B/11)
L422,427 : 31.2MHz level

TX-RX 2 UNIT (D/11)
TC403 : Lock volatge (HF REF VCO)

TX-RX 2 UNIT (E/11)
TC406 : Lock volatge (VHF REF VCO)

TX-RX 2 UNIT (G/11)
TC404 : Lock volatge (UHF PLL)

TX-RX 2 UNIT (H/11)
TC405 : Lock volatge (VHF MAIN PLL)

TX-RX 2 UNIT (I/11)
TC402 : Lock voltage (HF LO2 PLL)

TX-RX 2 UNIT (J/11)
TC408 : Lock voltage (HF1 MAIN PLL)
TC409 : Lock voltage (HF3 MAIN PLL)
TC410 : Lock voltage (HF2 MAIN PLL)

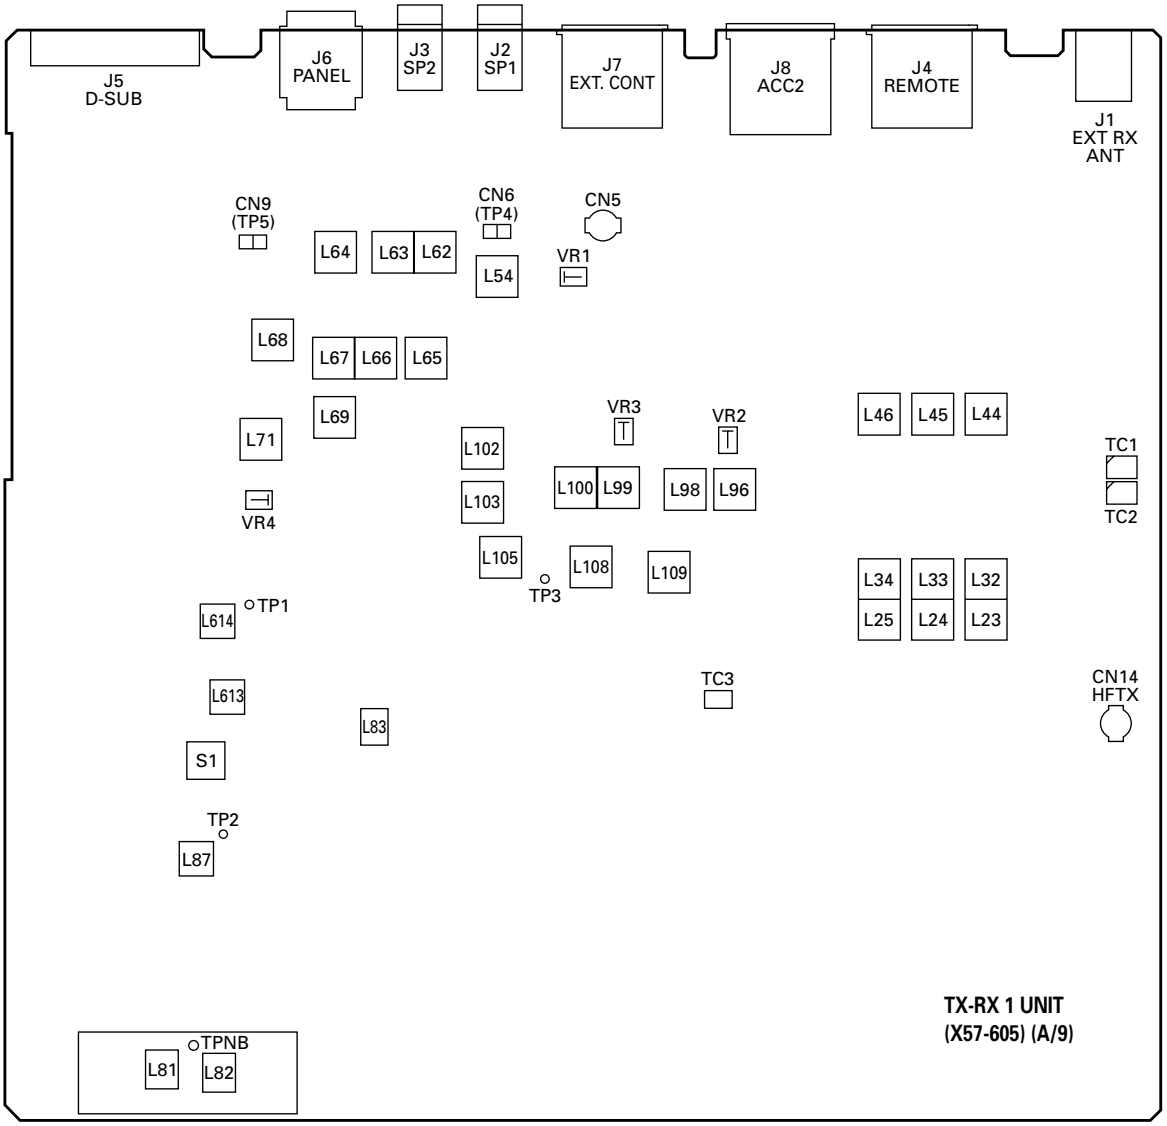
TX-RX 2 UNIT (K/11)
TC400 : Lock volatge (SUB1 PLL)
TC401 : Lock voltage (SUB2 PLL)

TX-RX 2 UNIT (A/11)
L23,34,47,55,163,164 : MAIN VHF BPF
L28,44,52 : Sub band BPF
L80,82,86 : RX IF gain (VHF)
L90,91,TC4~6,8,10 : TX BPF (UHF)
L93 : Sub band FM discriminator coil (VHF)
TC1~3,9 : MAIN UHF BPF
TC9 : Trap frequency (UHF)
TC12~14 : TX BPF (VHF)

FINAL UNIT (B/2)
VR901,902 : Final idling current (UHF)
TC901 : UHF maximum powe

ADJUSTMENT

Adjustment Points (Lower Side)



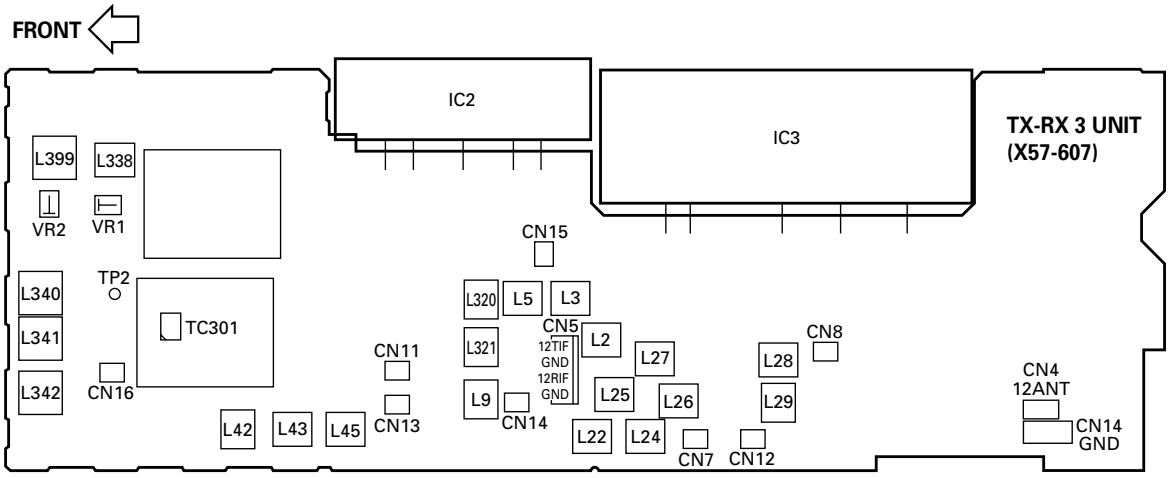
FRONT

TX-RX 1 UNIT (A/9)

L23~25,32~34,44~46 : HF BPF
L54,62~64,68 : MCF (69.085MHz)
L65~67 : MCF (72.925MHz)
L69,71,87,613,614 : HF RX IF gain
L81,82 : NB gain
L83 : FM discriminator coil (HF)
L96,98~100,102,103,105,108,109 : TX IF gain (HF)
L96,98,99,100,102,VR3 : TX IF BPF (HF)
VR1 : 1st mixer balance
VR2 : TX mixer balance
VR4 : Gain balance
TC1,2 : RX trap (E type only)
TC3 : 29.1MHz frequency

ADJUSTMENT

1200MHz Adjustment Points



TX-RX 3 UNIT

L2,3,9 : TX IF gain
L5,320,321 : MCF (135.395MHz)
L22,24,25,29 : RX IF gain
L26~28 : MCF (135.495MHz)
L42,43,45 : LO level (Local osc)
L338~342,VR1 : PLL reference level
VR2 : PLL reference spurious
TC301 : VCO control voltage

TERMINAL FUNCTION

FINAL UNIT (X45-360 A/2)

CN No.	Pin No.	Name	I/O	Function
CN5	1	14S	O	Switched 14V for external antenna tuner option
	2	AGND	-	Analog GND
	3	TT	I/O	External antenna tuner (AT-300) in/through control
	4	TS	I/O	External antenna tuner (AT-300) tuning start control
	5	GND	-	GND
CN9	1	14V	O	Constantly 14V
	2	GND	-	GND
	3	GND	-	GND
	4	SPG	-	GND for internal speaker
	5	SP	I	Audio output for internal speaker
	6	14AG	O	GND for audio IC
	7	14AF	O	Power supply for audio IC
	8	14S	O	14V when the power switch on
	9	14S	O	14V when the power switch on
	10	8A	O	8V when the power switch on (analog)
	11	8A	O	8V when the power switch on (analog)
	12	5A	O	5V when the power switch on (analog)
	13	HFTXB	I	HF-50MHz TXB
	14	14TXB	I	144MHz TXB
	15	VSF	O	Forward wave detection voltage of HF-144MHz VSWR
	16	VSR	O	Reflected wave detection voltage of HF-144MHz VSWR
	17	GND	-	GND
	18	NC	-	NC
CN10	1	GND	-	GND
	2	TT	I/O	External antenna tuner (AT-300) in/through control
	3	TS	I/O	External antenna tuner (AT-300) tuning start control
	4	PSC	I	Power on switch control. "H" for power on
	5	BOVR	O	Over voltage detection signal, if the power supply voltage increases more than approx. 19V. Then BOVR becomes "L"
	6	THHF	O	Thermistor detection voltage. This voltage controls fan speed
	7	PHD	O	Output voltage of phase detector in Filter unit
	8	AMD	O	Output voltage of amplitude detector in Filter unit
	9	14D	O	Constantly 14V for digital circuit
	10	8D	O	8V when the power switch on (digital)
	11	10A	O	10V when the power switch on (analog)
	12	8A	O	8V when the power switch on (analog)
	13	DATA	I	Serial data
	14	CLK	I	Serial clock
	15	REN1	I	Enable for IC205
	16	REN2	I	Enable for IC801, 802, 803
CN15	1	NC	-	NC
	2	GND	-	GND
	3	50RL	O	50MHz TX LPF relay control. "H" for LPF active
	4	10RL	O	10MHz TX LPF relay contro. "H" for LPF active
	5	28RL	O	28MHz TX LPF relay control. "H" for LPF active
	6	7RL	O	7MHz TX LPF relay control. "H" for LPF active
	7	21RL	O	21MHz TX LPF relay control. "H" for LPF active
	8	14RL	O	14MHz TX LPF relay control. "H" for LPF active
	9	4RL	O	3.5MHz TX LPF relay control. "H" for LPF active
	10	2RL	O	1.8MHz TX LPF relay control. "H" for LPF active
	11	144RL	O	144MHz TX/RX relay control. "H" for TX
	12	NC	-	NC
CN16	1	VSF	I	Forward wave detection voltage of HF-50MHz, comes from Filter unit then combine with 144MHz VSF
	2	VSR	I	Reflected wave detection voltage of HF-50MHz, comes from Filter unit then combine with 144MHz VSR
	3	PHD	I	Output voltage of phase detector in Filter unit, which passes through Final unit then goes to control unit
	4	AMD	I	Output voltage of amplitude detector in Filter unit, which passes through Final unit then goes to control unit
	5	5A	O	5V when the power switch on (analog)
	6	HFRL	O	HF TX/RX antenna changeover relay control, "H" for TX
	7	ATS	O	Internal antenna tuner in/through changeover relay control, "H" for antenna tuner input

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
	8	ANT	O	Antenna 1/2 changeover relay control. "H" for antenna 2
	9	GND	-	GND
	10	NC	-	NC
CN27	1	14S	O	14V when the power switch on
	2	GND	-	GND
	3	GND	-	GND

FINAL UNIT (X45-360 B/2)

CN No.	Pin No.	Name	I/O	Function
CN902	1	UTHV	O	UHF thermal protection detection voltage
	2	43VSF	O	UHF forward wave detection voltage
	3	UTXB	I	UHF TX 8V
	4	14S	I	14V when the power switch on
	5	14S	I	14V when the power switch on
	6	43VSR	O	UHF reflected wave detection voltage
	7	GND	-	GND
	8	GND	-	GND

FILTER UNIT (X51-315)

CN No.	Pin No.	Name	I/O	Function
CN9	1	NC	-	NC
	2	GND	-	GND
	3	50RL	I	50MHz TX LPF relay control. "H" for LPF active
	4	10RL	I	10MHz TX LPF relay control. "H" for LPF active
	5	28RL	I	28MHz TX LPF relay control. "H" for LPF active
	6	7RL	I	7MHz TX LPF relay control. "H" for LPF active
	7	21RL	I	21MHz TX LPF relay control. "H" for LPF active
	8	14RL	I	14MHz TX LPF relay control. "H" for LPF active
	9	4RL	I	3.5MHz TX LPF relay control. "H" for LPF active
	10	2RL	I	1.8MHz TX LPF relay control. "H" for LPF active
	11	144RL	I	144MHz TX/RX relay control. "H" for TX
	12	NC	-	NC
CN10	1	VSF	O	Forward wave detection voltage of HF-50MHz, comes from Filter unit then combine with 144MHz VSF
	2	VSR	O	Reflected wave detection voltage of HF-50MHz, comes from Filter unit then combine with 144MHz VSR
	3	PHD	O	Output voltage of phase detector in Filter unit, which passes through Final unit then goes to control unit
	4	AMD	O	Output voltage of amplitude detector in Filter unit, which passes through Final unit then goes to control unit
	5	5A	I	5V when the power switch on (analog)
	6	HFRL	I	HF TX/RX antenna changeover relay control. "H" for TX
	7	ATS	I	Internal antenna tuner in/through changeover relay control. "H" for antenna tuner input
	8	ANT	I	Antenna 1/2 changeover relay control. "H" for antenna 2
	9	GND	-	GND
	10	NC	-	NC

CONTROL UNIT (X53-391)

CN No.	Pin No.	Name	I/O	Function
CN1	1	FEN2	O	Enable
	2	FEN1	O	Enable
	3	CLK	O	Serial clock
	4	DATA	O	Serial data
	5	8A	I	8V when the power switch on (analog)
	6	10A	I	10V when the power switch on (analog)
	7	8D	I	8V when the power switch on (digital)
	8	14D	I	Constantly 14V for digital circuit
	9	AMD	I	Output voltage of amplitude detector in Filter unit
	10	PHD	I	Output voltage of phase detector in Filter unit
	11	THHF	I	Thermistor detection voltage. This voltage controls fan speed
	12	BOVR	I	Over voltage detection signal, if the power supply voltage increases more than approx. 19V. Then BOVR becomes "L"
	13	PSC	O	Power on switch control. "H" for power on
	14	TS	I/O	External antenna tuner (AT-300) tuning start control
	15	TT	I/O	External antenna tuner (AT-300) in/through control

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
	16	GND	-	GND
CN3	1	5V	O	5V
	2	GND	-	GND
	3	PSW	I	Power switch, "L" for power on
	4	INIT	I	"H" for CPU initialize
	5	5D	O	Common 5V for LED
	6	GND	-	GND
CN4	1	DGND	-	GND (Digital)
	2	PBCK	O	Buck up signal (Sub CPU)
	3	PCHK	O	Panel connection check
	4	RES	O	Reset signal (Sub CPU)
	5	TXDO	I	TX data (Main CPU)
	6	RXDO	O	RX data (Main CPU)
	7	RTSO	I	Data transmit inhibit signal (Main CPU)
	8	CTSO	O	Data transmit inhibit signal (Main CPU)
	9	5D	O	5V (Digital)
	10	8A	O	8V (LED)
	11	PRG3	-	
	12	PRG2	-	
	13	PRG1	-	
	14	PSW	I	Power switch output signal
	15	5V	-	
	16	10A	O	10V (Lamp, PLL power supply)
	17	GND	-	GND
	18	GND	-	GND
CN5	1	NC	-	NC
	2	GND	-	GND
	3	THU	I	UHF thermal protection detection voltage
	4	GND	-	GND
	5	SSM	I	Sub band S-meter input
	6	SSQ	I	Sub band squelch input
	7	SALT	I	Sub band auto lock tune input
	8	SRBK	O	Sub band RF blanking signal
	9	REN1	O	IC2 enable
	10	CLK	O	Serial clock
	11	DATA	O	Serial data
	12	NC	-	NC
	13	KEY	I	Key down signal
	14	KYS	I	Key jack judgement signal
	15	DASH	I	Electronic keyer dash signal
	16	DOT	I	Electronic keyer dot signal
	17	GND	-	GND
	18	NC	-	NC
CN6	1	GND	-	GND
	2	12EN3	O	Enable 3 for 1.2GHz unit
	3	12THV	–	Reserved
	4	12UL	I	PLL unlock detect, "L" when 1.2GHz PLL is unlocked
	5	12EN2	O	Enable 2 for 1.2GHz unit
	6	12EN1	O	Enable 1 for 1.2GHz unit
	7	PDA	O	PLL data (1.2GHz unit)
	8	PCK	O	PLL clock (1.2GHz unit)
	9	CKY	O	CW keying, Active "H" to transmit actual wave of all emission
	10	MALT	I	Main auto lock tune (kind of auto frequency control), main discriminator DC output
	11	DEN6	O	DDS enable 6 (IC601)
	12	DEN5	O	DDS enable 5 (IC603)
	13	DEN4	O	DDS enable 4 (IC602)
	14	IEN5	O	IF enable 5 (IC15)
	15	IEN4	O	IF enable 4 (IC14)
	16	IEN3	O	IF enable 3 (IC17)
	17	IEN2	O	IF enable 2 (IC16)
	18	IEN1	O	IF enable 1 (IC5)
	19	CLK	O	Serial clock
	20	DATA	O	Serial data
	21	ALCM	I	ALC meter voltage
	22	VSRM	I	Reflected wave detection voltage of HF-50MHz VSWR
	23	VSFM	I	Forward wave detection voltage of HF-50MHz VSWR
	24	12RXC	O	1.2GHz RX control, Active "H" to enable 1.2GHz RX
	25	12TXC	O	1.2GHz TX control, Active "H" to enable 1.2GHz TX
	26	URXC	O	UHF RX control, Active "H" to enable 430MHz RX
	27	UTXC	O	UHF TX control, Active "H" to enable 430MHz TX
	28	VRXC	O	VHF RX control, Active "H" to enable 144MHz RX
	29	VTXC	O	VHF TX control, Active "H" to enable 144MHz TX
	30	HRXC	O	HF~50MHz RX control, Active "H" to enable HF-50MHz RX
	31	HTXC	O	HF~50MHz TX control, Active "H" to enable HF-50MHz TX
	32	MSQ	I	Main SQ signal output (detected noise ; DC)
	33	MSM	I	Main S-meter signal output

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
	34	MRBK	O	Main receive blanking control.
				"H" for blanking
	35	AGCR	O	AGC reference voltage
	36	BATT	I	Back up battery input for MODEM
CN7	1	10A	O	10V (PLL power supply)
	2	PDA	O	PLL serial data
	3	PCK	O	PLL serial clock
	4	DEN3	O	DDS IC (IC407) enable
	5	DEN2	O	DDS IC (IC406) enable
	6	DEN1	O	DDS IC (IC408) enable
	7	PEN6	O	PLL IC (IC402) enable
	8	PEN5	O	PLL IC (IC401) enable
	9	PEN4	O	PLL IC (IC412) enable
	10	PEN3	O	PLL IC (IC410) enable
	11	PEN2	O	PLL IC (IC414) enable
	12	PEN1	O	PLL IC (IC409, 411) enable
	13	PENA	O	Serial/parallel IC (IC404) enable
	14	HFTXC	O	reserved
	15	VTXC	O	VHF-TX control signal,
				"H" when VHF TX is active
	16	UTXC	O	UHF-TX control signal,
				"H" when UHF TX is active
	17	VRXC	O	VHF-RX control signal,
				"H" when VHF main RX is active
	18	URXC	O	UHF-RX control signal,
				"H" when UHF main RX is active
	19	UL	I	PLL unlock detection, "L" active
	20	GND	-	GND
CN503	1	MIC	I	Mic signal input
	2	MSG	-	Mic GND
	3	MCG	-	GND
	4	MU	I	Mic up signal
	5	MD	I	Mic down signal
	6	SS	I	Standby switch
	7	8A	O	8V (EXT Mic)
CN504	1	PRGS	I	"L" for MAIN CPU write
	2	12OP	I	"H" when 1.2GHz unit installed
	3	GND	-	GND
	4	VO	I	VS-3 audio output
	5	GND	-	GND
	6	NAR	O	"H" for data input enable to VS-3
	7	RST	O	VS-3 reset signal
	8	VCS	O	VS3 voice synthesizer start signal
	9	GND	-	GND
	10	DRM	O	Audio in for DRU-3A
	11	GND	-	GND

CN No.	Pin No.	Name	I/O	Function
	12	DRO	I	Audio out from DRU-3A
	13	GND	-	GND
	14	EOM	I	End of message from DRU-3A.
				"H" for end
	15	DREN	O	Enable for DRU-3A voice recording
				unit
	16	STS	O	Start switch, active "H". When START
				is "H", CPU get this signal then send
				back STS to IF unit to turn ON IC10,
				11, 604.
	17	AMU	O	Audio Mute, Active "H" to mute SP1/
				SP2 output
	18	GND	-	GND
	19	MANO	O	Main RX AF signal from DSP
	20	GND	-	GND
	21	SANO	O	Sub RX AF signal from DSP
	22	GND	-	GND
	23	PKD	I	Packet (modulation) data, packet
				modulation data for DSP
	24	GND	-	GND
	25	SS	I	Standby switch, active low to TX
	26	PKSA	I	Packet standby switch, active "L" to
				packet TX
	27	RTK	I	RTTY keying, active "L" to frequency
				shift
	28	SPS	I	Speaker switch, "OPEN" when SP2
				is active
	29	RXD1	I	Level converted (5V) RXD
				(J6 : REMORT PANEL)
	30	TXD1	O	Level converted (5V) TXD
				(J6 : REMORT PANEL)
	31	START	I	Active "H" when data comes from
				REMOTE PANEL or PC
	32	RXD2	O	Level converted (5V) RXD
				(J5 : RS-232C)
	33	RTS2	I	Level converted (5V) RTS
				(J5 : RS-232C)
	34	TXD2	I	Level converted (5V) TXD
				(J5 : RS-232C)
	35	CTS2	O	Level converted (5V) CTS
				(J5 : RS-232C)
	36	GND	-	GND
CN505	1	MAF	O	Main audio (SP1) output
	2	GND	-	GND
	3	SAF	O	Sub audio (SP2) output
	4	GND	-	GND

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
CN506	1	MOD	O	Modulation output
	2	GND	-	GND
	3	MDET	I	Main band detection input
	4	GND	-	GND
	5	SDET	I	Sub band detection input
	6	GND	-	GND

DISPLAY UNIT (X54-332)

CN No.	Pin No.	Name	I/O	Function
CN1	1	DGND	-	GND (Digital)
	2	NC	-	NC
	3	NC	-	NC
	4	LRES	I	Reset signal (Dot LCD IC)
	5	NC	-	NC
	6	LCS4	I	Chip selector 4 (Serial/parallel IC)
	7	LCS3	I	Chip selector 3 (Dot LCD IC)
	8	LCS2	I	Chip selector 2 (7 seg LCD IC)
	9	LCS1	I	Chip selector 1 (7 seg LCD IC)
	10	LDA	I	LCD serial data
	11	LCK	I	LCD serial clock
	12	LMO	I	Mode set up signal (7 seg LCD IC)
	13	LINH	I	Display inhibit signal (7 seg LCD IC)
	14	5D	I	5V (Digital)
	15	KA	O	Key matrix output A
	16	KB	O	Key matrix output B
	17	KC	O	Key matrix output C
	18	S0	I	Key matrix input 0
	19	S1	I	Key matrix input 1
	20	S2	I	Key matrix input 2
	21	S3	I	Key matrix input 3
	22	PSW	O	Power switch output signal
	23	NC	-	NC
	24	LEDB	I	LED power supply voltage
	25	10A	I	10V (Lamp)
	26	GND	-	GND

TX-RX 1 UNIT (X57-605 A/9)

CN No.	Pin No.	Name	I/O	Function
CN16	1	MAF	I	Main audio (SP1) input from DSP
	2	GND	-	GND
	3	SAF	I	Sub audio (SP2) input from DSP
	4	GND	-	GND
CN17	1	MOD	I	Modulation input, Modes other than FM : 12kHz IF input, FM mode : AF input
	2	GND	-	GND
CN18	1	MDET	O	Main detect output, Modes other than FM : 12kHz IF output, FM mode : AF output
	2	GND	-	GND
CN20	1	VCK	I	Clock for VS-3
	2	VDT	I	Data for VS-3
	3	VCS	I	VS-3 voice synthesizer start signal
	4	RST	I	VS-3 reset signal
	5	NAR	I	"H" for data input enable to VS-3
	6	E	-	GND
	7	5C	I	Common 5V
	8	VO	O	VS-3 audio output
CN21	1	AGND	-	Analog GND
	2	DRMG	-	AF GND
	3	DRM	I	Audio input for DRU-3A
	4	DRO	O	Audio output from DRU-3A
	5	5D	I	Common 5V
	6	DGND	-	Digital GND
	7	EOM	I	End of message from DRU-3A "H" for end
	8	NC	-	NC
	9	DREN	I	Enable for DRU-3A voice recording unit
	10	SD	I	Data for DRU-3A
	11	SCK	I	Serial clock for DRU-3A
CN24	1	GND	-	GND
	2	CTS2	I	Level converted (5V) CTS (J5 : RS-232C)
	3	TXD2	O	Level converted (5V) TXD (J5 : RS-232C)
	4	RTS2	O	Level converted (5V) RTS (J5 : RS-232C)
	5	RXD2	I	Level converted (5V) RXD (J5 : RS-232C)
	6	START	O	Active "H" when data comes from REMOTE PANEL or PC
	7	TXD1	I	Level converted (5V) TXD (J6 : REMORT PANEL)
	8	RXD1	O	Level converted (5V) RXD (J6 : REMORT PANEL)
	9	SPS	O	Speaker switch, "OPEN" when SP2 is active
	10	RTK	O	RTTY keying, Active "L" to frequency shift
	11	PKSA	O	Packet standby switch, active "L" to packet TX
	12	SS	O	Standby switch, active low to TX
	13	GND	-	GND
	14	PKD	O	Packet (modulation) data, packet modulation data for DSP
	15	GND	-	GND
	16	SANO	I	Sub RX AF signal from DSP
	17	GND	-	GND
	18	MANO	I	Main RX AF signal from DSP

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
	19	GND	-	GND
	20	AMU	I	Audio Mute, active "H" to mute SP1/ SP2 output
	21	STS	I	Start switch, active "H". When START is "H", CPU gets this signal, then send back STS to this unit to turn ON IC10, 11, 604.
	22	DREN	I	Enable for DRU-3A Voice recording unit
	23	EOM	O	End of message from DRU-3A "H" for end
	24	GND	-	GND
	25	DRO	O	Audio out from DRU-3A
	26	GND	-	GND
	27	DRM	I	Audio in for DRU-3A
	28	GND	-	GND
	29	VCS	I	VS3 voice synthesizer start signal
	30	RST	I	VS-3 reset signal
	31	NAR	I	"H" for data input enable to VS-3
	32	GND	-	GND
	33	VO	O	VS-3 audio output
	34	GND	-	GND
	35	12OP	O	"H" when 1.2GHz unit installed
	36	PRGS	O	"L" for MAIN CPU write
CN25	1	BATT	O	Back up battery output for MODEM
	2	AGCR	I	AGC reference voltage
	3	MRBK	I	Main receive blanking control. "H" for blanking
	4	MSM	O	Main S-meter signal output
	5	MSQ	O	Main SQ signal output (detected noise ; DC)
	6	HTXC	I	HF~50MHz TX control, Active "H" to enable HF-50MHz TX
	7	HRXC	I	HF~50MHz RX control, Active "H" to enable HF-50MHz RX
	8	VTXC	I	VHF TX control, Active "H" to enable 144MHz TX
	9	VRXC	I	VHF RX control, Active "H" to enable 144MHz RX
	10	UTXC	I	UHF TX control, Active "H" to enable 430MHz TX
	11	URXC	I	UHF RX control, Active "H" to enable 430MHz RX
	12	12TXC	I	1.2GHz TX control, Active "H" to enable 1.2GHz TX
	13	12RXC	I	1.2GHz RX control, Active "H" to enable 1.2GHz RX

CN No.	Pin No.	Name	I/O	Function
	14	VSFM	O	Forward wave detection voltage of HF-50MHz VSWR, amplified by IC19
	15	VSRM	O	Reflected wave detection voltage of HF-50MHz VSWR, amplified by IC19
	16	ALCM	O	ALC meter voltage
	17	DATA	I	Serial data
	18	CLK	I	Serial clock
	19	IEN1	I	IF enable 1 (IC5)
	20	IEN2	I	IF enable 2 (IC16)
	21	IEN3	I	IF enable 3 (IC17)
	22	IEN4	I	IF enable 4 (IC14)
	23	IEN5	I	IF enable 5 (IC15)
	24	DEN4	I	DDS enable 4 (IC602)
	25	DEN5	I	DDS enable 5 (IC603)
	26	DEN6	I	DDS enable 6 (IC601)
	27	MALT	O	Main auto lock tune (kind of auto frequency control), main discriminator DC output
	28	CKY	I	CW keying, Active "H" to transmit actual wave of all emission
	29	PCK	I	PLL clock (1.2GHz unit)
	30	PDA	I	PLL data (1.2GHz unit)
	31	12EN1	I	Enable 1 for 1.2GHz unit
	32	12EN2	I	Enable 2 for 1.2GHz unit
	33	12UL	O	PLL unlock detect, "L" when 1.2GHz PLL is unlocked
	34	12THV	-	Reserved
	35	12EN3	I	Enable 3 for 1.2GHz unit
	36	GND	-	GND
CN26	1	GND	-	GND
	2	43VSF	I	Forward wave detection voltage of 430MHz VSWR
	3	14S	O	14V when the power switch on
	4	14S	O	14V when the power switch on
	5	43VSR	I	Reflected wave detection voltage of 430MHz VSW
	6	UTXB	O	430MHz TXB approx. 8V
	7	VTXB	O	144MHz TXB approx. 8V
	8	AGC	O	AGC
	9	5C	O	Common 5V
	10	TBPF	O	Control voltage for variable capacitor of TX BPF

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
	11	SBPF	O	Control voltage for variable capacitor of SUB RX BPF
	12	8C	O	Common 8V
	13	MBPF	O	Control voltage for variable capacitor of Main RX BPF
	14	URXB	O	430MHz RXB approx. 8V
	15	VRXB	O	144MHz RXB approx. 8V
	16	UATT	O	UHF RX attenuater, "H" active
	17	VATT	O	VHF RX attenuater, "H" active
	18	GND	-	GND
CN27	1	GND	-	GND
	2	12EN3	O	Enable 3 for 1.2GHz unit
	3	PCK	O	PLL clock (1.2GHz unit)
	4	PDA	O	PLL data (1.2GHz unit)
	5	12EN1	O	Enable 1 for 1.2GHz unit
	6	12EN2	O	Enable 2 for 1.2GHz unit
	7	12UL	I	PLL unlock detect, "L" when 1.2GHz PLL is unlocled
	8	12THV	-	Reserved
	9	12OP	I	"H" when 1.2GHz unit installed
	10	AGC	O	AGC voltage for 1.2GHz unit
	11	12RXB	O	1.2GHz RXB
	12	12TXB	O	1.2GHz TXB
	13	NC	-	NC
	14	5C	O	Common 5V
	15	12VSR	I	Reflected wave detection voltage of 1.2GHz VSWR
	16	12VSF	I	Forward wave detection voltage of 1.2GHz VSWR
	17	GND	-	GND
	18	NC	-	NC
CN29	1	14V	I	Constantly 14V
	2	GND	-	GND
	3	GND	-	GND
	4	SPG	-	GND for internal speaker
	5	SP	O	Audio output for internal speaker
	6	14AG	I	GND for audio IC
	7	14AF	I	Power supply for audio IC
	8	14S	I	14V when the power switch on
	9	14S	I	14V when the power switch on
	10	8A	I	8V when the power switch on (analog)
	11	8A	I	8V when the power switch on (analog)
	12	5A	I	5V when the power switch on (analog)
	13	HFTXB	O	HF-50MHz TXB
	14	14TXB	O	144MHz TXB
	15	VSF	I	Forward wave detection voltage of HF-144MHz VSWR
	16	VSR	I	Reflected wave detection voltage of HF-144MHz VSWR
	17	GND	-	GND
	18	NC	-	NC
CN31	1	SP1	O	Main AF output to phone jack
	2	SP2	I	Main AF input from phone jack
	3	PHG		GND for phone jack
CN32	1	SP3	O	Sub AF output to phone jack
	2	SP4	I	Sub AF input from phone jack
	3	PHG	-	GND for phone jack
	4	NC	-	NC

TX-RX 1 UNIT (X57-605 B/9)

CN No.	Pin No.	Name	I/O	Function
CN800	1	DGND	-	GND (Digital)
	2	PBKC	I	Buck up signal (Sub CPU)
	3	PCHK	I	Panel connection check
	4	RES	I	Reset signal (Sub CPU)
	5	TXD0	O	TX data (Main CPU)
	6	RXD0	I	RX data (Main CPU)
	7	RTS0	O	Data transmit inhibit signal (Main CPU)
	8	CTS0	I	Data transmit inhibit signal (Main CPU)
	9	5D	I	5V (Digital)
	10	8A	I	8V (LED)
	11	NC	-	NC
	12	NC	-	NC
	13	NC	-	NC
	14	PSW	O	Power switch output signal
	15	NC	-	NC
	16	10A	I	10V (Lamp, PLL power supply)
	17	GND	-	GND
	18	GND	-	GND
CN801	1	DGND	-	GND (Digital)
	2	NC	-	NC
	3	NC	-	NC
	4	LRES	O	Reset signal (Dot LCD IC)
	5	NC	-	NC
	6	LCS4	O	Chip selector 4 (Serial/parallel IC)
	7	LCS3	O	Chip selector 3 (Dot LCD IC)
	8	LCS2	O	Chip selector 2 (7 seg LCD IC)
	9	LCS1	O	Chip selector 1 (7 seg LCD IC)
	10	LDA	O	LCD serial data
	11	LCK	O	LCD serial clock

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
	12	LMO	O	Mode set up signal (7 seg LCD IC)
	13	LINH	O	Display inhibit signal (7 seg LCD IC)
	14	5D	O	5V (Digital)
	15	KA	I	Key matrix input A
	16	KB	I	Key matrix input B
	17	KC	I	Key matrix input C
	18	S0	O	Key matrix output 0
	19	S1	O	Key matrix output 1
	20	S2	O	Key matrix output 2
	21	S3	O	Key matrix output 3
	22	PSW	I	Power switch input signal
	23	NC	-	NC
	24	LEDB	O	LED power supply voltage
	25	10A	O	10V (Lamp)
	26	GND	-	GND
CN804	1	5D	O	5V (Encoder)
	2	MENB	I	Main encoder pulse B
	3	MENA	I	Main encoder pulse A
	4	DGND	-	GND (Digital)
CN805	1	DGND	-	GND (Digital)
	2	5D	O	5V (Digital)
	3	SUBS	I	Sub ON/OFF switch input signal
	4	SSQL	I	Sub SQL VR analog voltage
	5	SAF	I	Sub AF VR analog voltage
	6	NC	-	NC
	7	MUL2	I	MULTI/CH encoder pulse 2
	8	MUL1	I	MULTI/CH encoder pulse 1
	9	RITB	I	RIT/SUB encoder pulse 2
	10	RITA	I	RIT/SUB encoder pulse 1
	11	NC	-	NC
	12	SUB	O	Control signal for SUB LED
	13	MULTI	O	Control signal for MULTI LED
	14	CON	O	Control signal for CON LED
	15	STA	O	Control signal for STA LED
	16	9.6K	O	Control signal for 9.6K LED
	17	LEDB	O	LED power supply
	18	NC	-	NC
CN806	1	5D	O	5V (VR)
	2	CWBC	I	CW beat cancel VR analog voltage
	3	MRF	I	Main RF VR analog voltage
	4	NC	-	NC
	5	NC	-	NC
	6	MAF	I	Main AF VR analog voltage
	7	MSQL	I	Main SQL VR analog voltage
	8	DGND	-	GND (Digital)

TX-RX 1 UNIT (X57-605 F/9)

CN No.	Pin No.	Name	I/O	Function
CN951	1	MIC	O	Mic signal output
	2	MSG	-	Mic GND
	3	MCG	-	GND
	4	MU	O	Mic up signal
	5	MD	O	Mic down signal
	6	SS	O	Standby switch
	7	8A	I	8V (EXT Mic)

TX-RX 1 UNIT (X57-605 G/9)

CN No.	Pin No.	Name	I/O	Function
CN950	1	SP1	I	Audio input for headphone
	2	SP2	O	Audio output when headphone through
	3	PHG	-	GND for phone jack
	4	SP3	I	Audio input for headphone
	5	SP4	O	Audio output when headphone through
	6	PHG	-	GND for phone jack

TX-RX 2 UNIT (X57-606 A/11)

CN No.	Pin No.	Name	I/O	Function
CN9	1	SDET	O	Sub RX detection output (144, 430MHz)
	2	GND	-	GND
CN10	1	RIF	O	Main RX IF output (144, 430MHz)
	2	GND	-	GND
CN12	1	UTHV	I	UHF thermal protection detection voltage
	2	43VSF	I	UHF forward wave detection voltage
	3	UTXB	O	UHF TX 8V
	4	14S	O	14V when the power switch on
	5	14S	O	14V when the power switch on
	6	43VSR	I	UHF reflected wave detection voltage
	7	GND	-	GND
	8	GND	-	GND
CN14	1	NC	-	NC
	2	GND	-	GND
	3	THU	O	UHF thermal protection detection voltage
	4	GND	-	GND
	5	SSM	O	Sub band S-meter output
	6	SSQ	O	Sub band squelch output
	7	SALT	O	Sub band auto lock tune output
	8	SRBK	I	Sub band RF blanking signal

TERMINAL FUNCTION

CN No.	Pin No.	Name	I/O	Function
	9	REN1	I	IC2 enable
	10	CLK	I	Serial clock
	11	DATA	I	Serial data
	12	NC	-	NC
	13	KEY	O	Key down signal
	14	KYS	O	Key jack judgement signal
	15	DASH	O	Electronic keyer dash signal
	16	DOT	O	Electronic keyer dot signal
	17	GND	-	GND
	18	NC	-	NC
CN17	1	GND	-	GND
	2	43VSF	O	Forward wave detection voltage of 430MHz VSWR
	3	14S	I	14V when the power switch on
	4	14S	I	14V when the power switch on
	5	43VSR	O	Reflected wave detection voltage of 430MHz VSW
	6	UTXB	I	430MHz TXB approx. 8V
	7	VTXB	I	144MHz TXB approx. 8V
	8	AGC	I	AGC
	9	5C	I	Common 5V
	10	TBPF	I	Control voltage for variable capacitor of TX BPF
	11	SBPF	I	Control voltage for variable capacitor of SUB RX BPF
	12	8C	I	Common 8V
	13	MBPF	I	Control voltage for variable capacitor of Main RX BPF
	14	URXB	I	430MHz RXB approx. 8V
	15	VRXB	I	144MHz RXB approx. 8V
	16	UATT	I	VHF RX attenuater, "H" active
	17	VATT	I	UHF RX attenuater, "H" active
	18	GND	-	GND

TX-RX 2 UNIT (X57-606 B/11)

CN No.	Pin No.	Name	I/O	Function
CN501	1	10A	I	10V (PLL power supply)
	2	PDA	I	PLL serial data
	3	PCK	I	PLL serial clock
	4	DEN3	I	DDS IC (IC407) enable
	5	DEN2	I	DDS IC (IC406) enable
	6	DEN1	I	DDS IC (IC408) enable
	7	PEN6	I	PLL IC (IC402) enable
	8	PEN5	I	PLL IC (IC401) enable
	9	PEN4	I	PLL IC (IC412) enable
	10	PEN3	I	PLL IC (IC410) enable
	11	PEN2	I	PLL IC (IC414) enable
	12	PEN1	I	PLL IC (IC409, 411) enable
	13	PENA	I	Serial/parallel IC (IC404) enable
	14	HFTXC	I	HF-TX control signal
	15	VTXC	I	VHF-TX control signal. "H" : VHF TX
	16	UTXC	I	UHF-TX control signal. "H" : UHF TX
	17	VRXC	I	VHF-RX control signal. "H" : VHF RX
	18	URXC	I	UHF-RX control signal. "H" : UHF RX
	19	UL	O	PLL unlock detection. "L" : Active
	20	GND	-	GND

TX-RX 3 UNIT (X57-607)

CN No.	Pin No.	Name	I/O	Function
CN1	1	14S	I	14V when the power switch on
	2	GND	-	GND
CN5	1	12TIF	I	1.2GHz TX IF (10.595MHz)
	2	GND	-	GND
	3	12RIF	O	1.2GHz RX IF (10.695MHz)
	4	GND	-	GND
CN6	1	GND	-	GND
	2	12EN3	I	Enable 3 for 1.2GHz unit
	3	PCK	I	PLL clock (1.2GHz unit)
	4	PDA	I	PLL data (1.2GHz unit)
	5	12EN1	I	Enable 1 for 1.2GHz unit
	6	12EN2	I	Enable 2 for 1.2GHz unit
	7	12UL	O	PLL unlock detect, "L" when 1.2GHz PLL is unlocled
	8	12THV	-	Reserved
	9	12OP	O	"H" when 1.2GHz unit installed
	10	AGC	I	AGC voltage for 1.2GHz unit
	11	12RXB	I	1.2GHz RXB
	12	12TXB	I	1.2GHz TXB
	13	NC	-	NC
	14	5C	I	Common 5V
	15	12VSR	O	Reflected wave detection voltage of 1.2GHz VSWR
	16	12VSF	O	Forward wave detection voltage of 1.2GHz VSWR
	17	GND	-	GND
	18	NC	-	NC

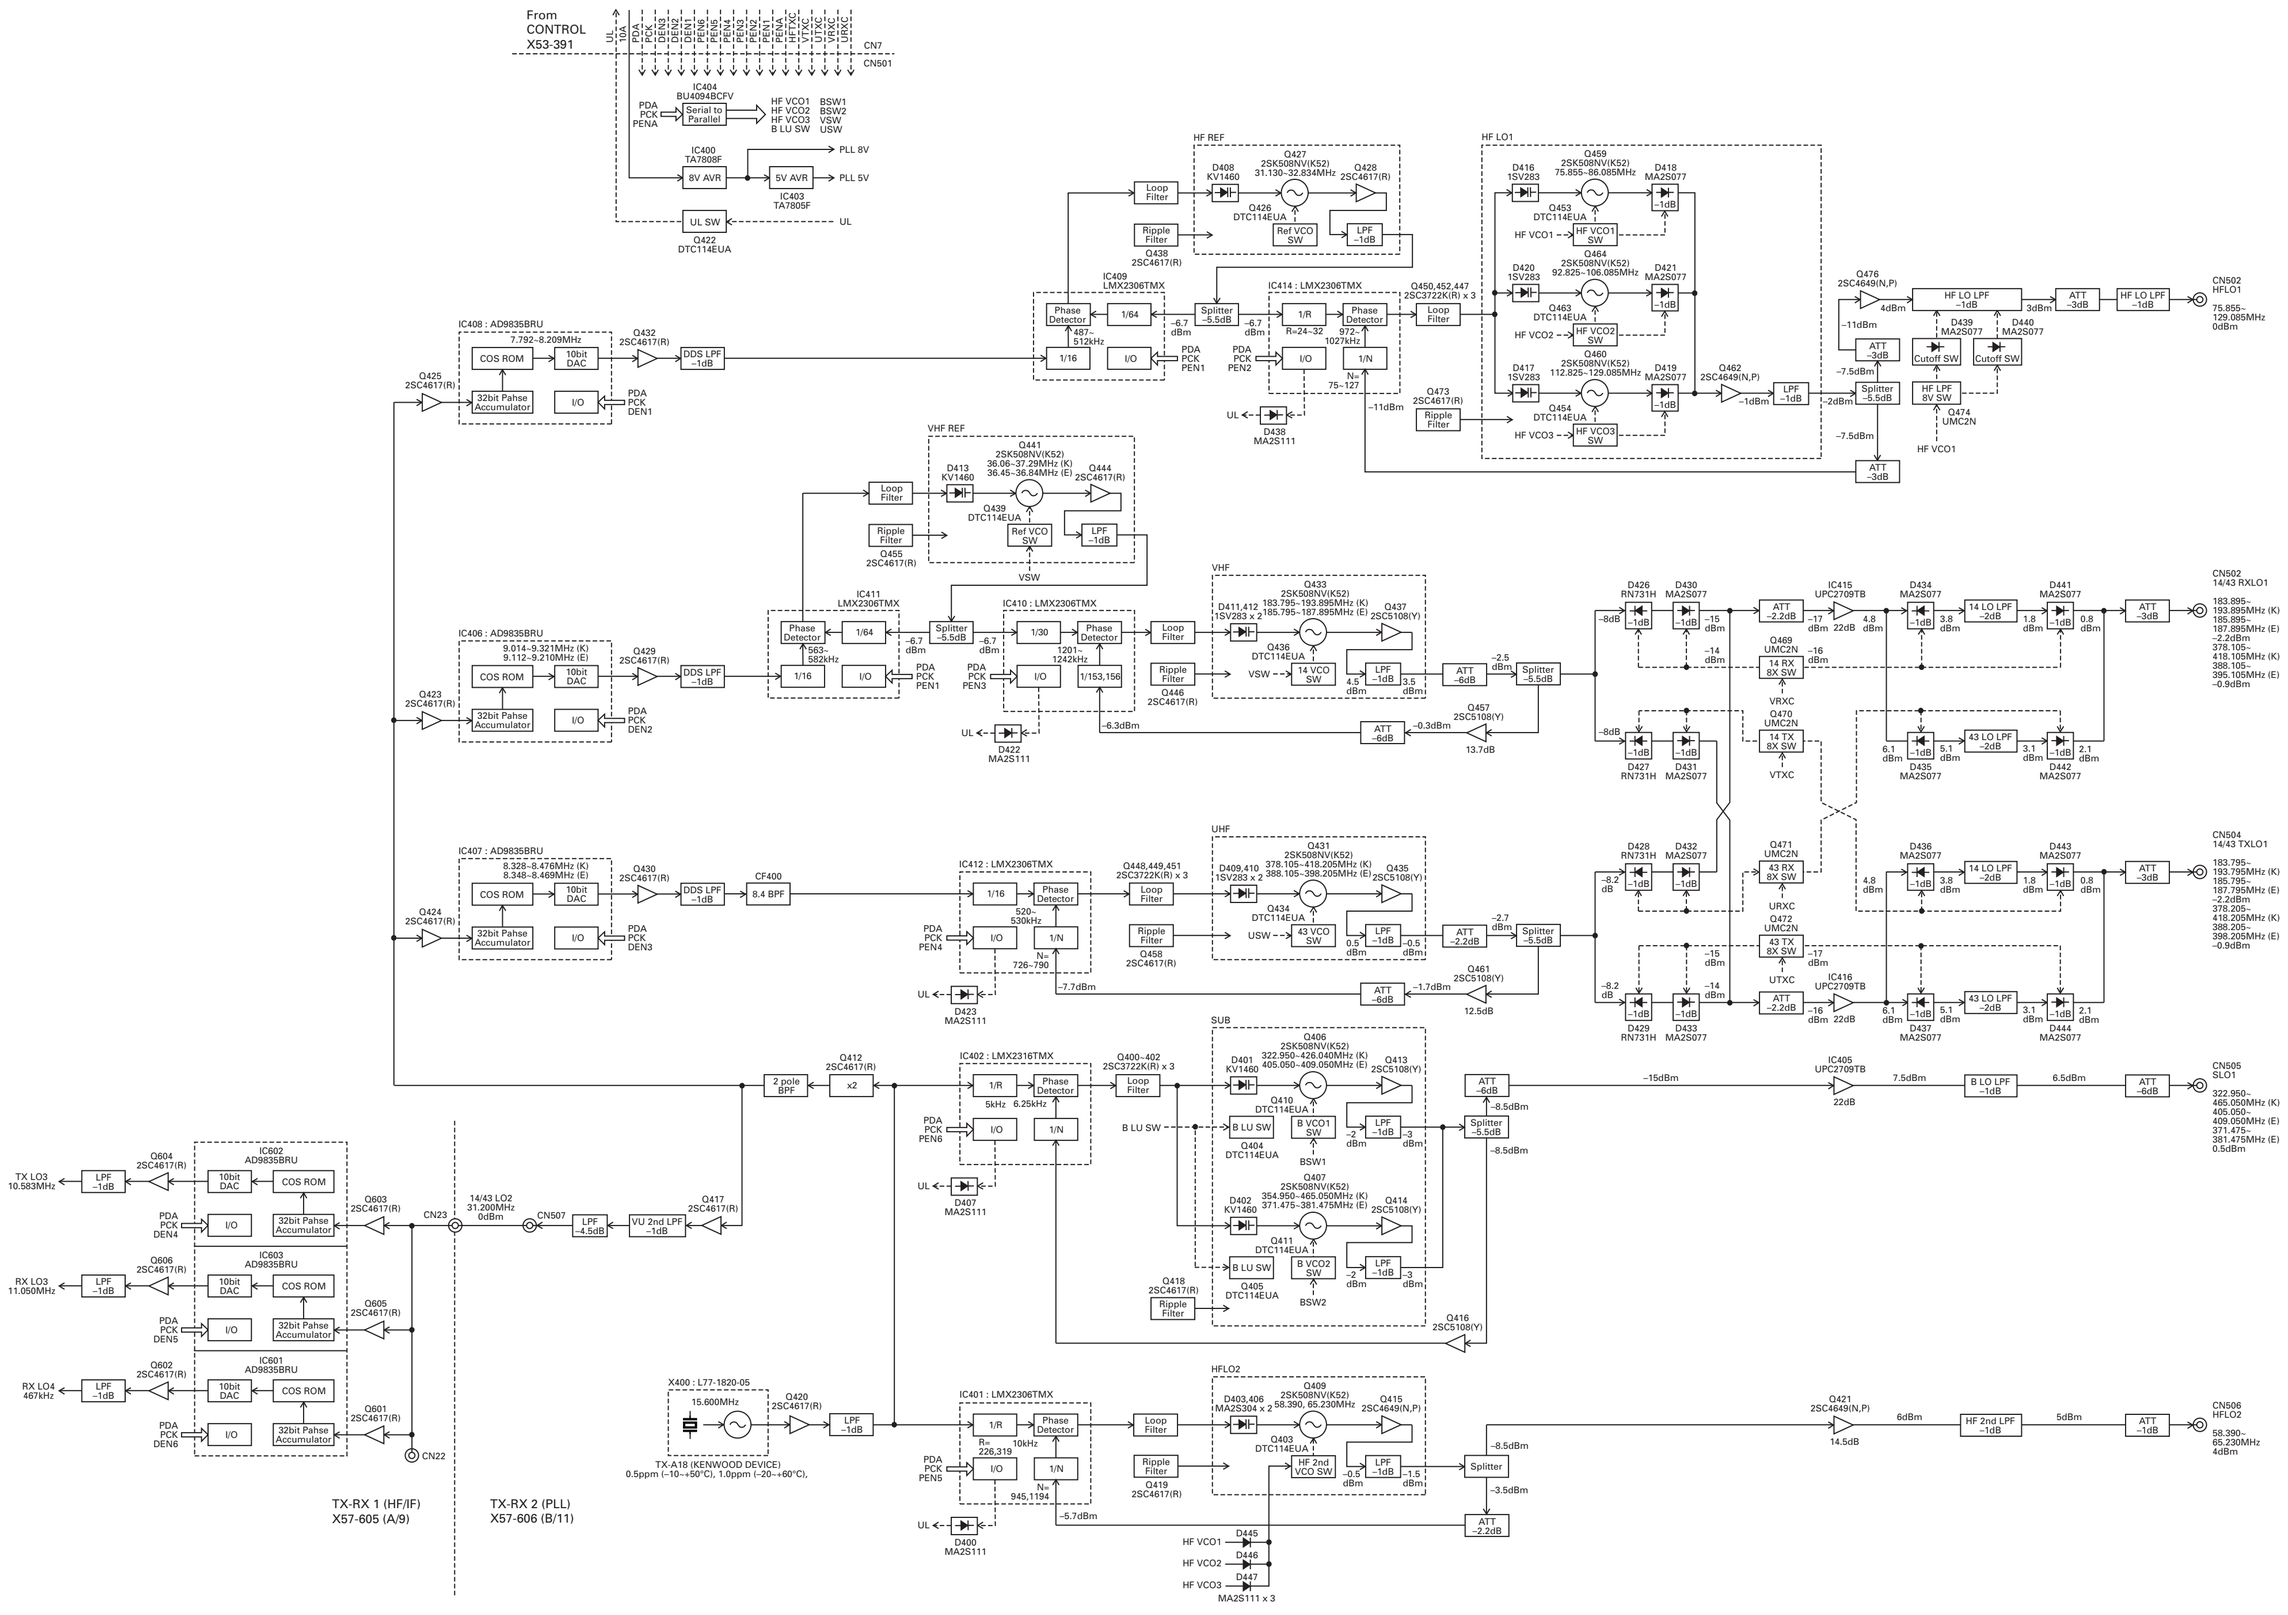
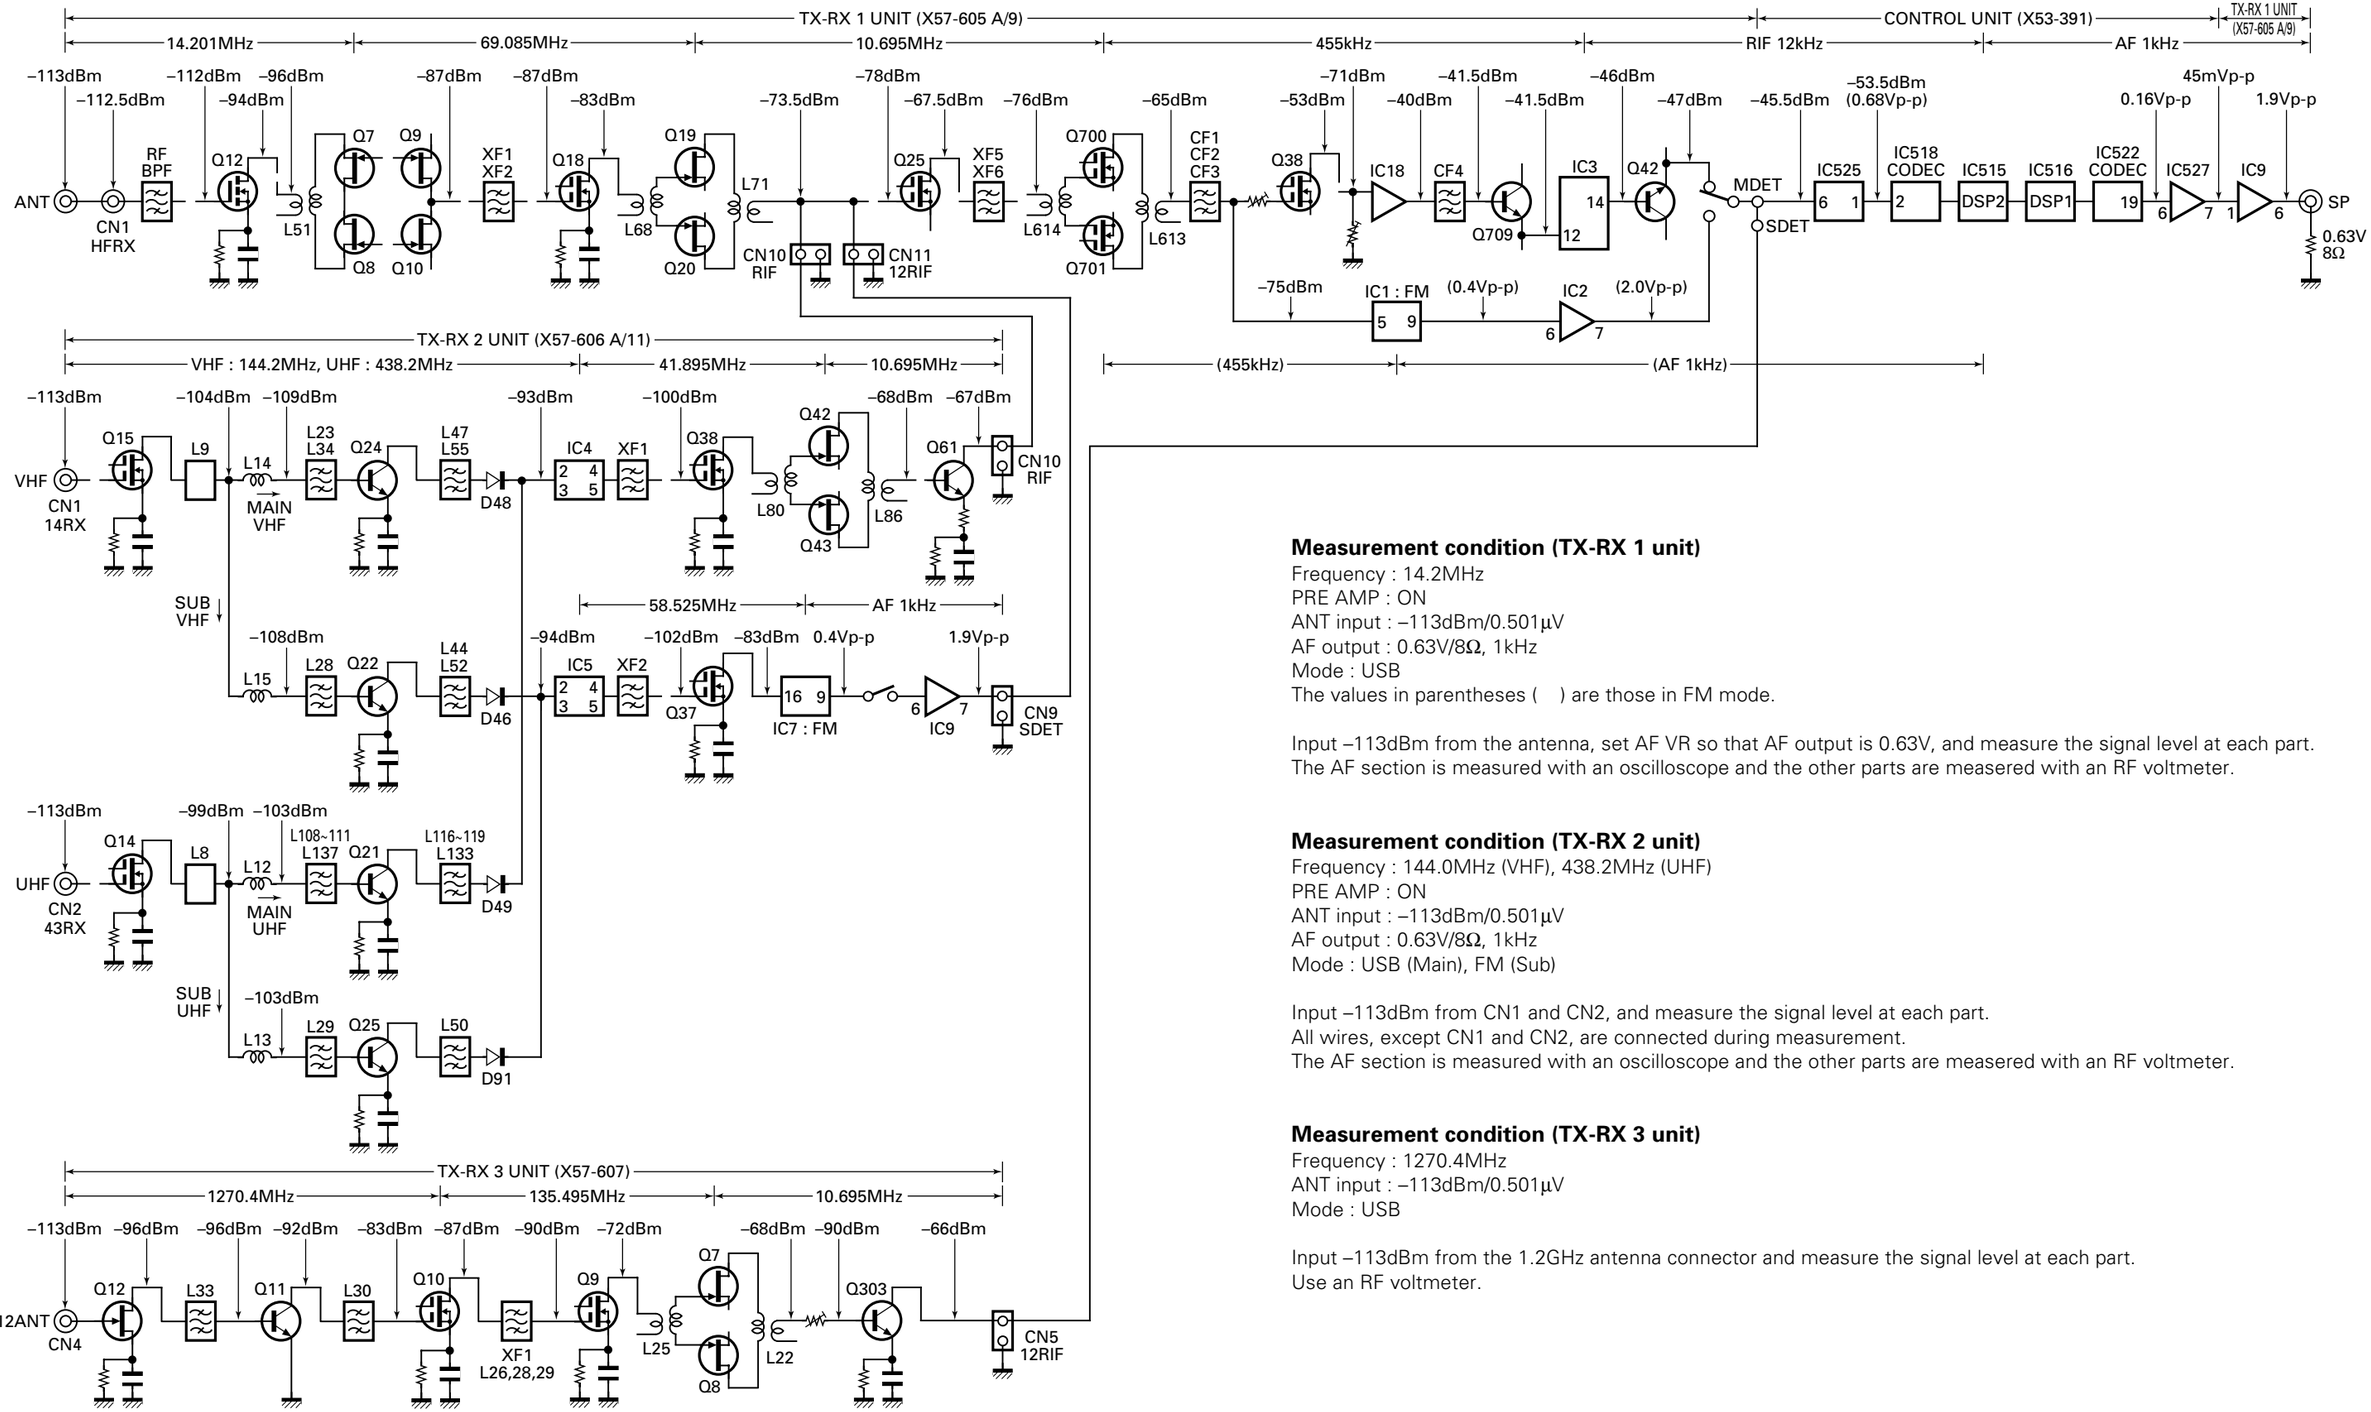
TS-2000/X BLOCK DIAGRAM



LEVEL DIAGRAM (RX SECTION)



Measurement condition (TX-RX 1 unit)
Frequency : 14.2MHz
PRE AMP : ON
ANT input : –113dBm/0.501μV
AF output : 0.63V/8Ω, 1kHz
Mode : USB
The values in parentheses ( ) are those in FM mode.

Input –113dBm from the antenna, set AF VR so that AF output is 0.63V, and measure the signal level at each part.
The AF section is measured with an oscilloscope and the other parts are measered with an RF voltmeter.

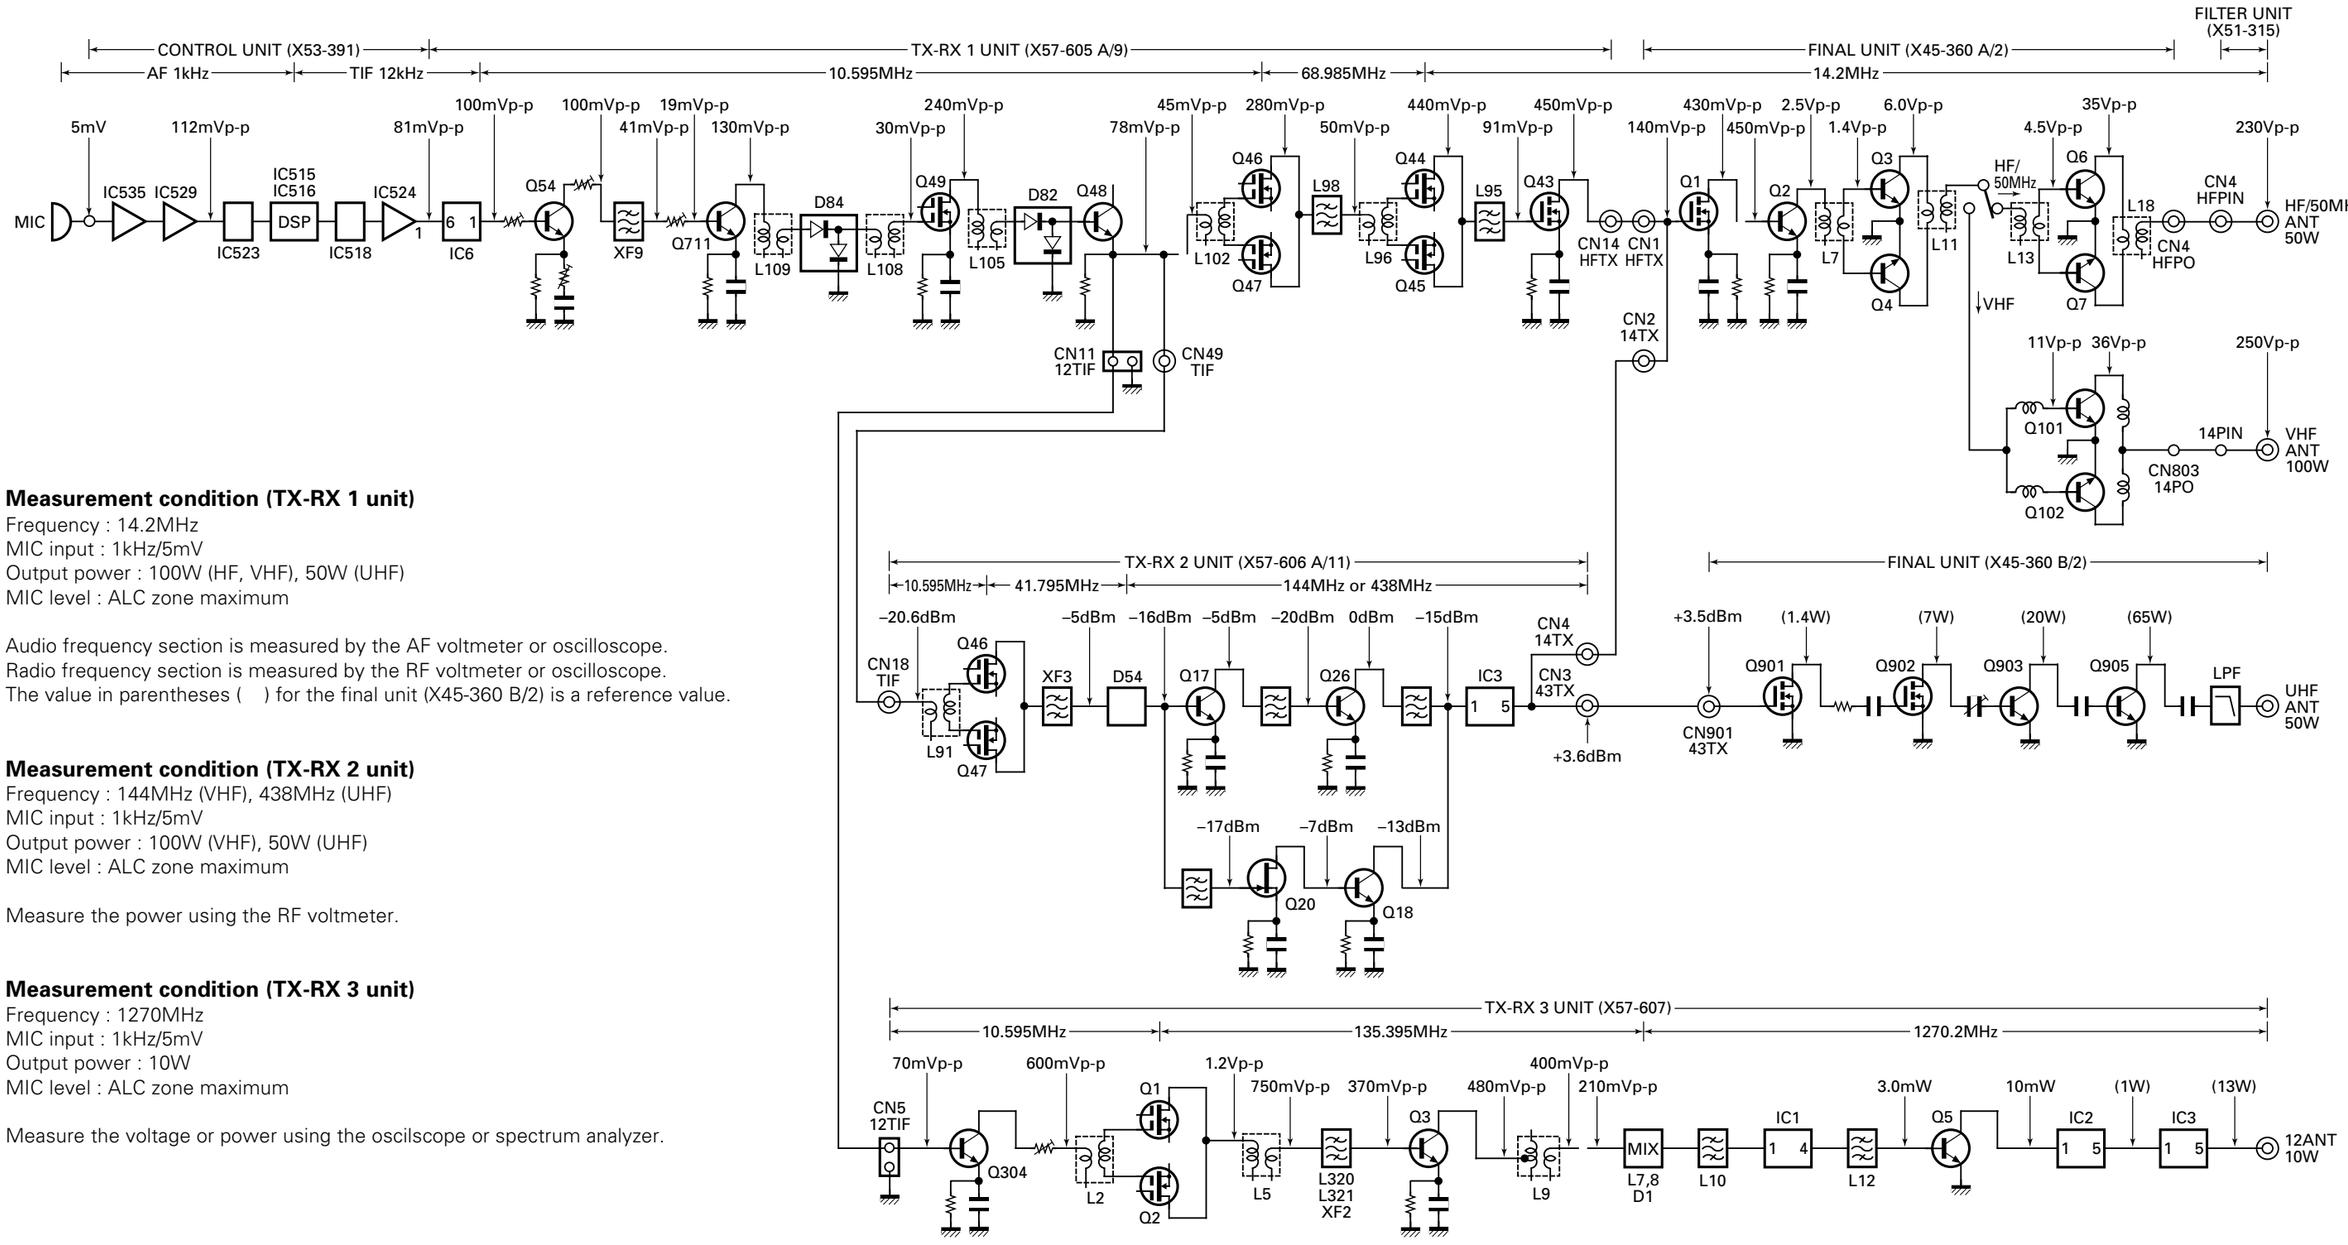
Measurement condition (TX-RX 2 unit)
Frequency : 144.0MHz (VHF), 438.2MHz (UHF)
PRE AMP : ON
ANT input : –113dBm/0.501μV
AF output : 0.63V/8Ω, 1kHz
Mode : USB (Main), FM (Sub)

Input –113dBm from CN1 and CN2, and measure the signal level at each part.
All wires, except CN1 and CN2, are connected during measurement.
The AF section is measured with an oscilloscope and the other parts are measered with an RF voltmeter.

Measurement condition (TX-RX 3 unit)
Frequency : 1270.4MHz
ANT input : –113dBm/0.501μV
Mode : USB

Input –113dBm from the 1.2GHz antenna connector and measure the signal level at each part.
Use an RF voltmeter.

LEVEL DIAGRAM (TX SECTION)



Measurement condition (TX-RX 1 unit)
Frequency : 14.2MHz
MIC input : 1kHz/5mV
Output power : 100W (HF, VHF), 50W (UHF)
MIC level : ALC zone maximum

Audio frequency section is measured by the AF voltmeter or oscilloscope.
Radio frequency section is measured by the RF voltmeter or oscilloscope.
The value in parentheses ( ) for the final unit (X45-360 B/2) is a reference value.

Measurement condition (TX-RX 2 unit)
Frequency : 144MHz (VHF), 438MHz (UHF)
MIC input : 1kHz/5mV
Output power : 100W (VHF), 50W (UHF)
MIC level : ALC zone maximum

Measure the power using the RF voltmeter.

Measurement condition (TX-RX 3 unit)
Frequency : 1270MHz
MIC input : 1kHz/5mV
Output power : 10W
MIC level : ALC zone maximum

Measure the voltage or power using the oscilscope or spectrum analyzer.

MC-52DM (MULTI-FUNCTION MICROPHONE WITH DTMF)

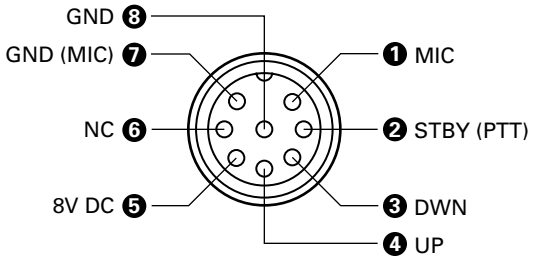
Parts List

Ref. No.	New parts	Parts No.	Description
		A02-1982-08	Case (Front)
		A02-1983-08	Case (Rear)
		E30-3243-08	Microphone cord assy (Metal)
		K29-5101-08	Knob (PTT)
		K29-5102-08	Knob (Up, Down)
		K29-5103-08	Key top (20 key)
		K29-5104-08	Knob (Lock)
SW3,4		S40-1117-05	Tact switch (Up, Down)
SW2		S62-0441-08	Slide switch (Lock)
SW1		S70-0465-08	Tact switch (PTT)
		T91-0570-08	Microphone element
IC1		LR40872	IC
Q1-3		2SC1623	Transistor

Connector End View

Metal plug (8P)



Specifications

Type ..... Electret capacitor
Power requirement ..... 8.0V DC ± 10%
Current drain ..... 35mA or less
Dimensions (WxHxD) ..... 65 x 90 x 30 mm
2-9/16 x 3-17/32 x 1-13/16 in
Weight ..... Approx. 180g / 6.3oz
Sensitivity .....–70dB±3dB (at 1kHz) (0dB = 1V/μbar)

Adjustment

Item	Condition	Test equipment / Measurement	Adjustment	Specifications / Remarks
DTMF output level	[3], [6] key at same time push		VR1	2.4mV±0.01mV

System requirements :

- IBM PC/AT and compatible machines with Microsoft® Windows®95 or Windows®98.
- Intel®Pentium®75MHz or higher processor (Pentium® 133MHz or higher recommended).
- CD-ROM Drive
- 800 x 600 screen resolution or higher.
- Mouse or compatible pointing device.
- RS-232C (Serial port)
- 6MB of RAM or higher.
- At least 5MB of available hard-disk space.

SPECIFICATIONS

General

Mode ..... J3E (LSB, USB) A1A (CW) A3E (AM) F3E (FM) F1D (FSK) F2D
Number of memory channels 300
Antenna impedance ..... 50Ω (With antena tuner 16.7 to 150Ω)
Supply voltage ..... DC 13.8V ± 15%
Ground method ..... Negative ground
Current
  Transmit (Max.) ..... 20.5A or less
  Receive (No signal) ..... 2.6A or less
Usable temperature range ..... –10°C to +50°C (+14°F to +122°F)
Frequency stability (–10°C to +50°C)
  Main Other mode ..... Within ±0.5 x 10^{-6} (Within ±0.5ppm)
  FM mode ..... ±0.5 x 10^{-6} ±2kHz
  Sub ..... ±0.5 x 10^{-6} ±600Hz
Frequency accuracy (at room temperature)
  Main Other mode ..... ±0.5 x 10^{-6} (±0.5ppm)
  FM mode ..... ±0.5 x 10^{-6} ±500Hz
  Sub ..... ±0.5 x 10^{-6} ±600Hz
Dimensions (W x H x D) ..... 270 x 96 x 317 mm / 10.6 x 3.8 x 12.5 in
  (Projections included) ..... (281 x 107 x 371 mm / 11.1 x 4.2 x 14.6 in)
Weight ..... TS-2000 : Approx. 7.8kg (17.2 lbs) TS-2000X : Approx. 8.2kg (18.1 lbs)

Transmitter

Frequency range
  160m band ..... 1.8 to 2.0MHz (K) 1.81 to 2.0MHz (E) 1.83 to 1.85MHz (E2)
  80m band ..... 3.5 to 4.0MHz (K) 3.5 to 3.8MHz (E,E2)
  40m band ..... 7.0 to 7.3MHz (K) 7.0 to 7.1MHz (E,E2)
  30m band ..... 10.1 to 10.15MHz
  20m band ..... 14.0 to 14.35MHz
  17m band ..... 18.068 to 18.168MHz
  15m band ..... 21.0 to 21.45MHz
  12m band ..... 24.89 to 24.99MHz
  10m band ..... 28.0 to 29.7MHz
  6m band ..... 50.0 to 54.0MHz (K) 50.0 to 52.0MHz (E) 50.0 to 50.2MHz (E2)
  2m band ..... 144 to 148MHz (K) 144 to 146MHz (E,E2)
  70cm band ..... 430 to 450MHz (K) 430 to 440MHz (E,E2)
  23cm band ..... 1240 to 1300MHz (TS-2000X)
Output power
  SSB/CW/FSK/FM Max. ..... 100W (1.8 to 144MHz) / 50W (430 (440) MHz) / 10W (1.2GHz)
  Min. ..... 5W (1.8 to 144MHz) / 5W (430 (440) MHz) / 1W (1.2GHz)
  AM Max. ..... 25W (1.8 to 144MHz) / 12.5W (430 (440) MHz) / 2.5W (1.2GHz)
  Min. ..... 5W (1.8 to 144MHz) / 5W (430 (440) MHz) / 1W (1.2GHz)
Modulation
  SSB ..... Balanced
  FM ..... Reactance
  AM ..... Low level
Spurious emissions
  1.8 to 29.7MHz ..... –50dB or less
  50.0 to 440 (450) MHz ..... –60dB or less
  1240 to 1300MHz ..... –50dB or less
Carrier suppression ..... 50dB or more
Unwanted sideband suppression (Modulation frequency 1.0kHz) ..... 50dB or more
Maximum frequency deviation (FM)
  Wide ..... ±5kHz or less
  Narrow ..... ±2.5kHz or less
XIT shift frequency range ..... ±20.0kHz
Microphone impedance 600Ω

SPECIFICATIONS

Receiver

Circuit type

Main band	SSB/CW/AM/FSK	Quadruple conversion superheterodyne	
	FM	Triple conversion superheterodyne	
Sub band	FM/AM	Duble conversion superheterodyne	

Frequency range ( ) : VFO coverage range

Main band	0.5 to 30MHz, 50 to 54MHz (0.03 to 60.0MHz)	
	144 to 148MHz (K) (142 to 152MHz (K))	144 to 146MHz (E,E2)
	430 to 145MHz (K) (420 to 450MHz (K))	430 to 440MHz (E,E2)
	1240 to 1300MHz (TS-2000X)	
Sub band	144 to 148MHz (K) (118 to 174MHz (K))	144 to 146MHz (E,E2)
	438 to 450MHz (K) (220 to 512MHz (K))	430 to 440MHz (E,E2)

Intermediate frequency (IF)

Main transceiver	1st IF	HF/50MHz band : 69.085MHz or 75.925MHz
		144/430 (440)MHz band : 41.895MHz 1200MHz band : 135.495MHz
	2nd IF	10.695MHz
	3rd IF	455kHz
	4th IF	12.0kHz
Sub receiver	1st IF	58.525MHz
	2nd IF	455kHz

Sensitivity

Main band	SSB/CW/FSK (S/N 10dB)	0.5 to 1.705MHz	: 4μV or less
		1.705 to 24.5MHz	: 0.2μV or less
		24.5 to 30.0MHz	: 0.13μV or less
		50.0 to 54.0MHz	: 0.13μV or less
		144 to 146MHz	: 0.11μV or less (E,E2)
		144 to 148MHz	: 0.16μV or less (K)
		430 to 440MHz	: 0.11μV or less (E,E2)
		430 to 450MHz	: 0.11μV or less (K)
		1240 to 1300MHz	: 0.11μV or less
	AM (S/N 10dB)	0.5 to 1.705MHz	: 31.6μV or less
		1.705 to 24.5MHz	: 2.0μV or less
		24.5 to 30.0MHz	: 1.3μV or less
		50.0 to 54.0MHz	: 1.3μV or less
		144 to 146MHz	: 1.0μV or less (E,E2)
		144 to 148MHz	: 1.4μV or less (K)
		430 to 440MHz	: 1.0μV or less (E,E2)
		430 to 450MHz	: 1.0μV or less (K)
		1240 to 1300MHz	: 1.0μV or less
	FM (12dB SINAD)	28.0 to 30.0MHz	: 0.22μV or less
		50.0 to 54.0MHz	: 0.22μV or less
		144 to 146MHz	: 0.18μV or less (E,E2)
		144 to 148MHz	: 0.25μV or less (K)
		430 to 440MHz	: 0.18μV or less (E,E2)
		430 to 450MHz	: 0.18μV or less (K)
		1240 to 1300MHz	: 0.18μV or less
Sub band	AM (S/N 10dB)	144 to 146MHz	: 1.55μV or less (E,E2)
		144 to 148MHz	: 2.25μV or less (K)
		430 to 440MHz	: 1.55μV or less (E,E2)
		438 to 450MHz	: 1.55μV or less (K)
	FM (12dB SINAD)	144 to 146MHz	: 0.28μV or less (E,E2)
		144 to 148MHz	: 0.40μV or less (K)
		430 to 440MHz	: 0.28μV or less (E,E2)
		438 to 450MHz	: 0.28μV or less (K)

Selectivity

Main band	SSB (Low cut : 300Hz / Hi cut : 2600Hz)	–6dB : 2.2kHz	–60dB : 4.4kHz
	AM (Low cut : 100Hz / Hi cut : 3000Hz)	–6dB : 6.0kHz	–50dB : 12.0kHz
	FM	–6dB : 12.0kHz	–50dB : 25.0kHz
Sub band	AM	–6dB : 12.0kHz	–50dB : 25.0kHz
	FM	–6dB : 12.0kHz	–50dB : 25.0kHz
